5. In *geom.*, a curve or surface touching a continuous series of curves or surfaces. Thus, suppose a plane curve to undergo a continuous change in its shape and position; then the curve as it is at any instant is intersected by the curve as it is at any subsequent instant, and the closer the second instant follows after the first the closer do these intersections approach certain positions on the first curve. These positions are points on the envelop, and in this way all the points on the envelop are determined. If *t* is a variable parameter, and *P* = 0 is the equation of the surface, then the equation obtained by eliminating *t* between *P* = 0 and *dP/dt* = 0 is the equation to the envelop. Or if there are two variable parameters, *s* and *t*, the equation of the envelop is obtained by eliminating them between *P* = 0, *dP/ds* = 0, and *dP/dt* = 0. Every curve may thus be regarded as an envelop. Caustics, evolutes, etc., are so by their definitions.—**Floral envelop**, the perianth of a flower. **Stamped envelop**, an envelop imprinted with a postage-

stamp or other sign of value by government authority, and sold at a post-office for use in the mail at its face value, usually with a small addition to cover the cost of paper and manila time.

The machine then gums the edge of the flap, dries the gum, folds the flap, counts the finished envelopes into bundles of twenty-five, delivers them, and records the total count. Sometimes the blanks are first cut to shape in a separate machine. The capacity of a good machine is estimated at 120 envelopes a minute, or 72,000 in one day.

The verb often expresses a much milder feeling than that which is usually denoted by the noun: one that may be consistent with perfect friendship and loyalty: as, I *envy* you your good health; I *envy* you your happy temper. But the feeling of envy is apt to beget repugnance and ill will, and some degree of these qualities is generally implied by the verb as well as by the noun.

If God had gone on still in the same method, and shortened our days as we multiplied our sins, we should have been but as an *ephemeron*; man should have lived the life of a fly or a gourd. *Jer. Taylor, Works* (ed. 1835), I. 254.

Ephesian (e-fē'zian), *a.* and *n.* [*< L. Ephesus*, *< Gr. Ἐφεσός*, *< Ἐφεσός*, Ephesus.] 1. *a.* Of or pertaining to Ephesus, an ancient city of Ionia on the coast of Asia Minor at the mouth of the river Cayster, famous as the seat of a peculiar form of the worship of Artemis, for the legends of Amazons connected with this cultus, for the magnificent temple of Artemis (the Artemision or Artemisium, commonly called the temple of Diana), and as a large and important commercial city. In Christian times Ephesus became noted as a center of St. Paul's work in Asia Minor (one of his epistles also being inscribed "to the Ephesians"), as one of the seven

churches of the Apocalypse, and as the residence and death-place of St. John, after whom a modern village on the site is called *Yusubak* (that is, *Yusub Θεολόγος*, the Holy Divine). It had the title of apostolic see, and its metropolitan had a rank nearly equal to that of patriarch, till overshadowed by the rise of the patriarchate of Constantinople. It was also the scene of a number of ecclesiastical councils, one of them ecumenical. Also *Ephesine*. **Ephesian Artemis**. See *Dianna*. **Ephesian or Ephesine Council**, any one of the several church councils held at Ephesus, the earliest of which met in A. D. 196 to settle a dispute as to the time of keeping Easter; especially, the third general or ecumenical council, held at Ephesus A. D. 431, under the emperors Theodosius II. and Valentinian III., the most prominent member of which was St. Cyril, patriarch of Alexandria. It deposed Nestorius, patriarch of Constantinople, and condemned his teaching as to the person of Christ. (See *Nestorianism*.) It also decreed that nobility should subject to himself any ecclesiastical province which had not from the beginning been under the authority of his predecessors, and that any province so subjected should be restored, and the original rights of each province always remain inviolate. **Ephesian or Ephesine Latrocinium**, a synodical council which met at Ephesus A. D. 449. It claimed to be ecumenical, but all its acts were annulled at the Chalcedonian council, A. D. 451. See *Latrocinium*. **Ephesian or Ephesine liturgies**, **Ephesine class**, **family**, or **group** (of liturgies), the group or class to which the ancient liturgies of Gaul and Spain belong, and probably those of Britain also. The original or typical form represented by the various extant offices of this family is called the *Ephesine liturgy*. The connection of this type of office with Ephesus is a matter of inference. It is also sometimes called the *liturgy of St. Paul* or of *St. John*. See *Gallikan*.

It includes a few marine fishes, among which the most notable are the species of *Chaetodontes*, as *C. tuberosus*, of the Atlantic coast of the United States, known in the markets of Washington and Baltimore as the *porcupine*, but not to be confounded with the porcupine of New York. It is an alteration due to the development of that kind of egg known as *ephippial*.

When the next moult takes place, these altered portions of the integument, constituting the *ephippia*, are cast off, together with the rest of the carapace, which soon disappears, and then the *ephippium* is left, as a sort of double-walled spring box (the spring being formed by the original dorsal junction of the two halves of the carapace) in which the ephippial ova are enclosed. The *ephippium* sinks to the bottom and, sooner or later, its contents give rise to young *Daphnia*.

On each shoulder was fixed an onyx stone set in gold and engraved with the names of six of the tribes of Israel, and just above the girdle was fixed the breastplate of judgment. (See *Ex. xxviii. 6-12*.) In later times the ephod was not worn exclusively by the high priest, but when worn by others, as priests of lower rank, it was usually made of linen.

Pertaining to or constituting an epos or heroic poem; narrating at length and in metrical form as a poetic whole with subordination of parts a series of heroic achievements or of events under supernatural guidance. only possible end of rational action, and that the ultimate pleasure is freedom from disturbance. In logic the Epicureans are distinguished from all the other ancient schools, not only in maintaining an experiential theory of cognition and the validity of inductive reasoning, but also in denying the value of definitions, syllogism, and the other apparatus of the *a priori* method. Like J. S. Mill, they based induction upon the uniformity of nature. Epicurus was very strenuous in the advocacy of natural causes for all phenomena, and in resisting hypotheses of the interference of supernatural beings in nature. He adopted the atomistic theory of Democritus, while bringing into it the doctrine of chance, which is the very life of that theory. His views were thus more like those of a modern scientist than were those of any other philosopher of antiquity. Owing, however, to the natural repugnance to doctrines seeming to lower the nature of man, Epicurus and his school have been much hated and abused; so that an *Epicurean* has come to mean also a mere votary of pleasure. See 2.

Copernicus also

made use of epicycles, which, however, were banished by Kepler.

The moon mooveth the contrarie from other planetes as in hure *epicycle*, but in non other manere.

It is used for converting circular into alternate motion, or alternate into circular. While the revolution of the smaller wheel is taking place, any point whatever on its circumference will describe a straight line, or will pass and repass through a diameter of the circle, once during each revolution. In practice a piston-rod or other reciprocating part may be attached to any point on the circumference of the smaller wheel.

Three epiglottidei are described in man, named *thyro-epiglottideus*, and *aryteno-epiglottideus superior* and *inferior*. epiglottis (ep-i-glot'is), *n.*; pl. *epiglottides* (-ī-dēz). [*< NL. epiglottis*, < Attic Gr. *ἐπίγλωττις*, common Gr. *ἐπίγλωσσις*, epiglottis, < *ἐπί*, upon, + *γλωττις*, γλωσσις, glottis; see *glottis*.] 1. A valve-like organ which helps to prevent the entrance of food and drink into the larynx during deglutition. In man the epiglottis is of oblong figure, broad and round above, attached by its narrow base to the anterior angle of the upper border of the thyroid cartilage or Adam's apple, and also to the hyoid or tongue-bone, and the tongue itself; its ligaments for these attachments are the thyro-epiglottic, hyo-epiglottic, and glosso-epiglottic, the latter three in number, forming folds of mucous membrane. The muscles of the epiglottis are three, the thyro-epiglottideus and the superior and inferior aryteno-epiglottideus. Its substance is elastic yellow fibrocartilage, covered with mucous membrane continuous with that of the fauces and air-passages. In its ordinary state, as during respiration, the epiglottis stands upon end, uncovering the opening of the larynx; during the act of deglutition it is brought backward so as to protect this orifice. Any similar structure in the lower animals receives the same name. See cuts under *alimentary* and *mouth*.

one of the episcopical vestments, consisting of a piece of brocade or some other stiff material shaped like a rhomb or lozenge, and worn on the right side at or below the knee, hanging by one of its angles from the zone or girdle. The other three angles have tassels attached to them, and it is embroidered with a cross or other ornamentation. As late as the eighth century, and in some places as late as the eleventh, a handkerchief or napkin (the *echabrite*, which see) was worn in a similar manner, as it still is in the Armenian Church, and the epigonation is probably a more modern form of this. Accordingly, some writers connect this vestment with the towel (ἀντήρ) with which Christ girded himself before washing the disciples' feet. *John* xiii, 5.

Attached to the . . . [zone], on the right side, the Bishop wears an ornament . . . termed the *epigonation*; it is . . . made of brocade, or some other stiff material, a tassel being attached to the lower corners. This was at first, like the Latin manipule, a mere handkerchief.

Sw. *epigram*, < L. *epigramma*, < Gr. *ἐπίγραμμα* (-), an inscription, an epigram, an epitaph, < *ἐπί*, upon, + *γράφω*, write, Cf. *epigram*.] 1. In *Gr. lit.*, a poetical inscription placed upon a tomb or public monument, as upon the face of a temple or public arch. The term was afterward extended to any little piece of verse expressing with precision a delicate or ingenious thought, as the pieces in the Greek Anthology. In Roman classical poetry the term was somewhat indiscriminately used to designate a short piece in verse; but the works of Catullus, and especially the epigrams of Martial, contain a great number with the modern epigrammatic character.

This *Epigramme* is but an inscription or writing made as it were upon a table, or in a window, or upon the wall or mantel of a chimney in some place of common resort.

Pottendamm, Arte of Eng. Poessie, p. 43.

Probably the first application of the newly adapted art [engraving words on stone or metal] was in dedicatory inscriptions or *epigrams*, to use this word in its original sense.

C. T. Newton, Art and Archaeol., p. 100.

Hence—2. In a restricted sense, a short poem or piece in verse, which has only one subject, and finishes by a witty or ingenious turn of thought; hence, in a general sense, an interesting thought represented happily in a few words, whether verse or prose; a pointed or antithetical saying.

The qualities rare in a bee that we meet

In an *epigram* never should fall;

The body should always be little and sweet,

And a sting should be left in its tail.

Trans. from Latin (author unknown).

From the time of Martial, indeed, the *epigram* came to be characterized generally by that peculiar point or sting which is now looked for in a French or English *epigram*; and the want of this in the old Greek compositions doubtless led some minds to think them tame and tasteless. The true or the best form of the early Greek epigram does not aim at wit or seek to produce surprise. *Lord Neaves*.

In episcopacy the order of bishops is superior to the other clergy, and has exclusive power to confer orders. Episcopacy is the organic system since early times of all the oriental churches (Greek, Armenian, Coptic, etc.) and of the Roman Catholic Church, and also of the Anglican Church and its various branches. These churches teach that it is of apostolic origin and essential to the maintenance of valid orders. Government by bishops was continued in the Scandinavian churches (called *Lotharism* in Denmark and Sweden, in the latter country apparently without interruption at the Reformation). The Moravian Church also claims an uninterrupted succession. The bishops of the Moravian and American Methodist Episcopal churches are itinerant, and have no special diocesan jurisdiction. The Mormons also have an officer called bishop. Maintainers of episcopacy hold that (whether the word *bishop*, ἐπίσκοπος, *episcopos*, was for a time equivalent to presbyter or not) there was in apostolic times an order of presbyters superior in authority to ordinary presbyters, consisting of the twelve apostles, other apostles, and their colleagues, who transmitted so much of their authority as was to be used in continuing and governing the ministry to successors, called *bishops* after the first century, constituting an order which has continued till the present day. **2.** The state of being a bishop; episcopal rank or office.

He has here writ a letter to you: I should have given it you to-day morning, but as a madman's *epistles* are no zospels, so it skills not much when they are delivered.

Shak., T. N., v, 1.

2. [*cap.*] In *liturgies*, one of the eucharistic lessons, taken, with some exceptions, from an epistolary book of the New Testament and read before the gospel. In the early church a lesson from the Old Testament, called the *prophesy*, preceded it, and such a lesson is still sometimes used instead of it. In the Greek Church the epistle (called the *apostle*, as also in the early church) is preceded by the *prokeimenon* and followed by "Peace to thee" and "Alleluia"; in the Western Church it is preceded by the collects and followed by the *deo gratias*, the gradual, tract, or alleluia, with the verse or sequence. It is read in the Greek Church by the anagnost or lector at the holy doors, and in the Western Church by the subdeacon or epistler (in the Roman Catholic Church the celebrant also reciting it in a low voice) at the south side of the altar, that is, at a part of the front of the altar on the celebrant's right as he faces it. Formerly it was read from the ambo (sometimes from a separate or epistle ambo) or pulpit, or from the step of the choir. Sometimes called the *lection* simply.

It is the external indication of tabulae, and is well seen in the *Tubipora*, or organ-pipe corals. It is a secondary calcareous investment, probably a tegumentary secretion, very commonly developed both in simple and in compound corals. In the former it is placed outside the proper wall, to which it may be closely applied, or separated by the costae. It may be very thin or quite dense, and in the latter case it is developed at the expense of the proper wall, which is then often indistinguishable. In compound corals it is not unusual to find a well-formed epitheca inclosing the whole corallum below, while each individual corallite has its own wall. See *tabula*.

epithelium (ep-i-thē-li-um), *n.* [NL., orig. used to designate the outer layer of the integument of the lips, which covers the papillae; *< Gr. ἐπι, upon, + θηλή, the nipple, teat, < θήεν, suckle*]. 1. In *anat.*, the superficial layer of cells of mucous membranes, covering the connective-tissue layer, corresponding to the epidermis of the outer skin and continuous with it at the mouth and other natural openings. The usual meaning of the word, however, is somewhat wider than this and includes all tissues similar in structure to the above. It embraces the proper tissue of secreting glands, whether derived from the hypoblast, as in the case of the gastric and intestinal glands, the liver and the pancreas, or from the epiblast, as in the case of the sudoriferous, sebaceous, and mammary glands, or from the mesoblast, as in the case of the kidneys, ovaries, and testes; it is applied, moreover, to the ependyma of the cerebrospinal ventricular cavities and to the epidermis itself. With what seems a distinct widening of its meaning, the

term is not infrequently employed to designate the endothelium of blood, and lymph channels and of serous membranes. The epithelium is thus the covering of all free surfaces, mucous, external, and even serous, and forms the glands and other organs derived from these coverings. Epithelial tissue consists of cells, usually compactly set; the nuclei are usually distinct, with an intranuclear network and nucleoli. The intercellular substance is scanty, often inappreciable, and is called *cement*. It contains no blood-vessels or lymphatics, but nerve fibrils extend into it. The epithelial tissue, forming the outermost covering of free surfaces, is favorably situated for performing protective and secreting functions. The protective function is not only exhibited by the general layer of easily replaced cells coating the mucous membrane and outer skin but in the latter case by a peculiar tendency to form keratin, and this results in a quite impervious outer horny layer, which guards against minor violence, the absorption of deleterious substances, and the invasion of pathogenic bacteria, as well as in the development of such especial means of protection as scales and feathers, hair and nails. This chemical feature of that epithelium which is especially devoted to protection, the production of keratin, can be matched by no single peculiarity on the part of the secretory epithelium; for that must respond equally whether it is called upon to eliminate waste products, or to elaborate digestive ferments, or to manufacture milk. It is probable that some of the cells lining the digestive tract have an active absorptive function with reference to the products of digestion, and that they select and take up certain substances from the intestine, and after more or less elaboration pass them on to the blood- or lymph-channels. This forms a kind of inverted secretion. The epithelial cells of secreting glands are, in part at least, under the direct control of the nervous system. Whether epithelial cells having a purely protective function are, as regards their nutrition, under similar control is still a question. See cuts under *Malpighian* and *villos*.

The *epithelium* is the epidermis of the mucous membrane. *Wilson, Anat. (1847)*, p. 540.

2. In *ornith.*, specifically, the dense, tough cuticular lining of the gizzard. It is sometimes even bony, and sometimes deciduous.—3. In *bot.*, a delicate layer of cells lining the internal cavities of certain organs, as the young ovary, etc.: also applied to the thin epidermis of petals.—**Ciliated epithelium**, any variety of true epithelium the cells of which are individually furnished on their free surface with cilia. The cells are usually of columnar form, packed closely side by side, with the cilia on their exposed ends. These cilia are microscopic processes of the cell, like eyelashes from an eyelid, and keep up a continual lashing or vibratile motion, by which mucus is swept along the passages.—**Ciliated epithelium** is found in man in the whole respiratory tract, the middle ear and Eustachian tube, the Fallopian tubes and part of the uterus, in portions of the seminal passages, and in the cavities of the brain and spinal cord.—**Columnar or cylindrical epithelium**, epithelium whose cells are more or less rod-like in shape, set on end, and joined together by their sides into a membrane. These cells are usually flattened or somewhat prismatic by mutual pressure. Goblet-cells are a modification of ordinary columnar epithelium cells, scattered here and there among the latter.—**Germinal epithelium**. See the extract.

The epithelial investment of the abdominal cavity retains its primitive character along a tract which corresponds to the rudiment of the primitive kidney longer than it does in other regions; and this epithelial layer may be distinguished as the *peritoneal epithelium*.

Gegenbauer, Comp. Anat. (trans.), p. 608.

Pavement epithelium, epithelium in which the cells are flattened and coherent by their irregular polygonal edges, like the tiles of a mosaic pavement. Also called *tessellated*, *squamous*, *lamellous*, *lamellar*, and *flattened epithelium*. It may be either simple, when it consists of a single layer of cells, as in the epithelium of the pulmonary alveoli, or stratified, when it consists of several layers, as in the epidermis.—**Simple epithelium**, any epithelium whose cells form a single layer: distinguished from *stratified epithelium*.—**Spheroidal epithelium**, glandular epithelium, characteristic of the terminal recesses and crypts of the secreting surfaces of glands, with more or less spherical or polyhedral cells.—**Stratified epithelium**, any epithelium whose cells are in two or more layers or strata, one upon another.—**Tegumentary epithelium**, the epidermis.—**Tessellated epithelium**. Same as *pavement epithelium*.—**Transitional epithelium**, stratified epithelium of three distinguishable layers of cells, such as occurs in the ureters and urinary bladder.—**Vascular epithelium**, the epithelial or endothelial lining of blood-vessels and lymphatics.

2. In *math.*, a proposition asserting the equal-
ity of two quantities, and expressed by the
sign = between them; or an expression of the
same quantity in two terms dissimilar but of
equal value: as, 3 lb. = 48 oz.; $x = b + m - r$.
In the latter case x is equal to b added to m with r
subtracted from the sum, and the quantities on the right hand
of the sign of equation are said to be the value of x on the
left hand. An equation is termed simple, quadratic, cubic,
or biquadratic, or of the 1st, 2d, 3d, or 4th degree, ac-
cording as the index of the highest power of the unknown
quantity is one, two, three, or four; and generally an
equation is said to be of the 5th, 6th, *n*th, etc., degree,
according as the highest power of the unknown quantity
is of any of these dimensions.

used to indicate that two or more definite bod-

within the sphere of chemical action, a reac-
tion will take place, and new bodies be pro-
duced. The symbols of the bodies which react on each
other form the left-hand member of the equation, and are
connected by the sign of equality with the symbols of the
products of the reaction. It is called an equation because
the weight of the substances reacting must exactly equal
the weight of the products of reaction.—**Abelian equation**.

namely,

$$\int \frac{dp}{\rho} + V - \frac{1}{2}v^2 = C,$$

stream-line and vortex-line, and in the case of irrotational
motion a constant for all space.—**Bessel's equation**,
the equation $x^2 y'' + x y' - (1 + x^2) y = 0$, the
solution of which involves the Besselian function. **Bi-
nomial equation**. See *binomial*. **Biquadratic equation**.
Such equations were first solved by the Italian
mathematician Ludovico Ferrari (1522-65). His method

is as follows. Let the biquadratic be $x^4 - ax^3 + bx^2 + cx - d = 0$. Find a root of the cubic $ay^3 - by^2 + (ac - 4d)y - d(a^2 - 4b) = 0$. Then the roots of the biquadratic are the same as those of the two quadratics

$$(x^2 - 4b - 4y)(x^2 - ax + y) - y^2 = 0, \\ x^2 - 4b - 4y(x^2 - 4b + 1) - ay - 2c = 0.$$

See *anal.* **Circulating equation**, a difference equation in which the coefficients take successive forms of a cycle of forms for successive values of the variable. Thus, if we have the equation $ux_{n+1} + vx_n = 0$ where $P = 1$ when x is divisible by 3, $P = x$ when $x - 1$ is divisible by 3, and $P = x^2$ when $x - 1$ is divisible by 3, the equation given is a circulating equation. **Clairaut's equation**, the equation $u = x \frac{du}{dx} - F \left(\frac{du}{dx} \right)$. **Complete equation**. See *incomplete equation*. **Compound equation**. See *incomplete equation*. **Connected equations**, a system of equations such that one of them can be deduced from the rest. **Constitutive equation**, the equation which expresses the conditions of a problem. **Construction of equations**. See *construction*. **Conversion of equations**. See *conversion*. **Cubic equation**, an equation of the third degree. The algebraic solution of the general cubic equation was discovered by Scipione dal Ferro (died 1525?). His method, commonly known as that of Cardan, and perfected by Hudde, is as follows: Let the cubic equation be $x^3 + 3ax^2 + 6bx + 2c = 0$. Divide the three subsidiary quantities, p, q, R , by means of the equations $p = 2b - a^2, q = a^3 - 3ab + c, R^2 = p^3 + q^2$. Then, denoting by ρ any cube root of unity and by the radical a real quantity,

$$x = \rho \sqrt[3]{-q + R} + \rho^2 \sqrt[3]{-q - R} - a,$$

which gives three values for the three values of ρ . If all the roots are real, this method is inconvenient; and we have the "irreducible case of Cardan's solution," when we may calculate two subsidiary quantities, x and θ , by the equations $x^3 = q^2 - R^2, \tan^2 \theta = -R^2/q^2$, and the three roots will be $x_1 = -2r \cos \theta - a, x_2 = -2r \cos(\theta + 120^\circ) - a, x_3 = -2r \cos(\theta - 120^\circ) - a$. **Darboux's equation**, the equation $Adx + Bdy + C(dx^2 + dy^2) = 0$, where A, B, C are rational functions of x and y . **Depression of an equation**. See *depression*. **Derived equation**, the equation which expresses the vanishing of the differential coefficient of a given equation. Thus, if $x^5 + x^3 = x^2 + 1$ is the given equation, the derived equation is $5x^4 + 3x^2 = 2x$. **Determinate equation**, an equation containing only one unknown quantity, or only as many as there are equations in the system. **Difference equation**, an equation expressing a relation between the value of a function for the values of several functions for all values of the variable or variables and the values when the several variables are increased by 1, 2, 3, etc. Thus, $f(x, y) = f(x - 1, y) + f(x, y - 3)$ is a difference equation. The *order* of a difference equation is equal to the difference between the highest and lowest values of the variable it involves. Thus, the equation just given is of the first order with respect to x and of the third order with respect to y . The *degree* of a difference equation is the degree of the highest differential coefficient as variables. Thus, $f(x^2 + 1)(x^2 + 1)^2 - f(x - 1) = 0$ is a difference equation of the second degree. But some mathematicians would make the degree of a difference equation strictly analogous to that of a differential equation. A linear difference equation with constant coefficients is solved by means of its characteristic equation (which see, above). **Differential equation**, an equation expressing a relation between functions and their differential coefficients. An *ordinary differential equation* is one which contains only one independent variable; a *partial differential equation* is one which contains two or more independent variables. The *order* of a differential equation is that of the highest differential coefficient it contains. The *degree* of a differential equation is that of the power to which the highest differential coefficient is raised when the equation is in rational form and freed from fractions. A *solution* of a differential equation is an equation containing no differentials nor partial coefficients, of explicit functions and such that the given differential equation can be deduced from it. A *general solution* is one which is as indeterminate as possible, that is, which contains the number of arbitrary constant functions indicated by the order of the equation. *Asymptotic solutions*, (a) with modern writers, a particular case of a particular case of the general solution; (b) with older writers, a solution not general. A *singular solution* is a solution which is neither general nor implied by the general solution. The *complete integral* of a partial differential equation is a solution containing the full number of arbitrary constant functions. **Disjunctive equation**. (a) The equation expressing the addition theorem of elliptic functions. (b) Any one of the usual equations of hydrodynamics, where the components of the velocity at fixed points of space are taken as variables; so called in contradistinction to the Lagrangian equations where the coordinates of a definite particle are taken as variables; these equations, though also discovered by Euler, having been used by Lagrange.

where T is the living force, Y the positional energy, u an element of position, and t the time. (b) A general equation of hydrodynamics, in which, instead of considering the velocity at each fixed point of space, the motion of each particle is followed out. This is called a Lagrangian equation because used by Lagrange in his "Mécanique Analytique," though invented by Euler. **Lame's equation**, the equation $2a \frac{dr}{dr^2} + (a^2 + 1)k^2 \sin^2 r + b \frac{dr}{dr} = 0$, where a is an integer and k is the modulus of the elliptic function $\sin r$. **Laplace's equation**, the equation

See *differential equation*. **Particular equation**, an equation which takes account of initial positions and velocities or other peculiarities of a special problem. **Personal equation**. (a) The constant which must be added to every time observed by one observer, in order to make the mean of such observations agree with those of another observer. If, for example, two observers note the times of passage of a series of stars over the same meridian, it will generally be found that one observer has a tendency to note the time later than the other, so that the mean difference, say for sets of twenty-five observations, presents some approach to constancy. In consequence of this, if we have to combine observations of the two observers, it will be proper to apply to all the observations of one of them a constant, in order to give the times such as they would have been observed by the other. This constant is the personal equation. The *absolute personal equation* is the amount which has to be added to the time as observed by any given observer in order to reduce the error of the mean of a large number of his observations to zero, or as nearly so as possible by any such constant correction. The personal equation is said to be eliminated when the observations are so treated that it does not affect the result. Thus, in determining the difference of longitude of two stations by the telegraphic transmission of the times of transit of stars over the two meridians, the result will be affected by the personal equation between the observers at the two stations. But if the observers afterward change places and redetermine the difference of longitude, the personal equation will enter into this second result with the opposite sign to that which it had before. Consequently, the mean of the two results will give a third result which is free from the effect of any constant personal equation. Hence, loosely, (b) Any kind of tendency to error of a determinate kind and amount peculiar to a given observer or reasoner for which it is possible to make any approximate allowance. **Physical equation**, in *astron.*, the displacement of a planet from the position which an equable circular motion would give it owing to the eccentricity of the orbit being only one half that of the equant. **Primitive equation**, any equation from which another is derived in any way. **Pure equation**, one in which each unknown occurs to only one degree. **Quadratic equation**, an equation of the second degree. Such equations were solved by the ancients. Given $ax^2 + 2bx + c = 0$, the solution is

$$x = \frac{-b \pm \sqrt{b^2 - \frac{AC}{B^2}}}{A}.$$

When B^2 is much larger than AC , the two roots are nearly

$$\frac{-2b}{A} + \frac{c}{2b} \quad \text{and} \quad -\frac{c}{2b} + \frac{AC}{8b^3}.$$

The general equations of the fifth and higher degrees cannot be solved by means of radicals. **Reciprocal equation**, an equation which is satisfied by the reciprocal of the unknown quantity. **Resolvent equation**, an algebraic equation which has to be solved in order to solve another equation. equator (ē-kwā-tōr), *n.* [*< ML. equator = F. equateur = Pg. equador = Sp. equador = It. equatore = D. equator = G. equator = Dan. ækvator = Sw. equator, < ML. aquator, the equator, < L. aquare, make equal: see equate.*] 1. In *astron.*, that imaginary great circle in the heavens the plane of which is perpendicular to the axis of the earth. It is everywhere 90° distant from the celestial poles, which coincide with the extremities of the earth's axis, supposed to be produced to meet the heavens, and its axis is this produced axis. It divides the celestial sphere into the northern and southern hemispheres. During his apparent yearly course the sun is twice in the equator, in the months of March and September. Then the day and night are everywhere equal, whence the name *equator*.

This same circle is cleped also the wyeore, *equator*, of the day, for when the soline is in the heydes of Aries & Libra, than ben the daies & the nyghts ilike of lengthe in al the world.

Chaucer, *Astrolobe*, l. 17.

As when his beamas at noon

2. In *geog.*, that great circle of the earth every point of which is 90° from the earth's poles, which are also its poles, its axis being also the axis of the earth. It is in the plane of the celestial equator. Our earth is divided by it into the northern and southern hemispheres. From this circle is reckoned the latitude of places both north and south.

Hence—3. A similarly situated circle about any spherical body, or the region adjacent to it. — **Eccentric equator**. Same as *equant*. — **Magnetic equator**, a line which nearly coincides with the geographical equator, and at every point of which the vertical component of the earth's magnetic attraction is zero—that is to say, a dipping-needle carried along it remains horizontal. It is hence called the *axial line*.

See *II.* — **Equatorial dial**. See *dial*. — **Equatorial migration**. See *migration*. — **Equatorial telescope or instrument**. See *II.*

II. *n.* An astronomical instrument contrived for the purpose of directing a telescope upon any celestial object of which the right ascension and declination are known, and of keeping the object in view for any length of time notwithstanding the diurnal motion. For these purposes a principal axis resting on firm supports is placed parallel to the axis of the earth's rotation, and consequently pointing to the poles of the heavens. On this polar axis there is placed, usually near one of its extremities, a graduated circle, the plane of which is perpendicular to the polar axis, and therefore parallel to the equator. This circle is called the *equatorial circle*, and measures by its arcs the hour-angles, or differences of right ascension. The polar axis carries a second circle, called the *declination circle*, the plane of which is at right angles to that of the equatorial circle. This last circle has a telescope attached to it for making observations, which moves along with it in the same plane. The name *equatorial*, or *equatorial instrument*, is sometimes given to any astronomical instrument which has its principal axis of rotation parallel to the axis of the earth.

equatorially (ē-kwā-tō-ri-āl-i), *adv.* In an equatorial manner; so as to have the motion or position of an equatorial.

Their duties fall in rotation, and when the sovereign rides abroad in state an equerry goes in the leading coach. Officers with the same denomination form part of the establishments of the members of the royal family.

tial line be joined by a conductor, no flow through the conductor will take place.—**Equipotential surface**, a surface throughout which the potential (see *potential*) is everywhere the same; one which is everywhere perpendicular to the lines of force which it meets. If a particle were subject to the attractions and repulsions of a number of bodies that were held motionless, there would be a resultant force upon it in some certain direction. If, while held so that it could not acquire momentum, it were either allowed to move as urged by the resultant force or compelled to move directly counter thereto, it would describe a course, called a *line of force*, having an attracting body at one extremity and a repelling one at the other, or else passing off to infinity in one direction or the other. Through every point of space there would be such a line; and a surface so bending as to be everywhere perpendicular to these lines of force would be an *equipotential* or *level surface*. If such a surface were to be rendered impenetrable, the particle could lie upon it without tendency to move along it in any direction. Similarly, if any two points of an electrically equipotential surface are joined by a conductor, no flow will take place. The term *equipotential* is most generally used as applying to electrical or magnetic forces, but is also extended to gravitational, or forces having any origin whatever.

Equisetaceæ (ēk-wi-sē-tā'sē-ē), *n. pl.* [NL., < *Equisetum* + *-aceæ*.] A very distinct natural order of vascular cryptogamous plants. Perennial, solid, running rootstocks are present in most cases, producing usually upright hollow stems with a grooved surface. In addition to the central canal of the latter, there is near the surface a circle of smaller canals (vallicular canals), opposite to the grooves (vallicules) which mark the surface. Opposite the another set of still smaller cavities (carinal canals). The stomata are in the grooves, in some species forming a row on each side of the groove. The cuticle of the stem in many species contains a large amount of silica. The stem is jointed, and the central canal is intercepted by a partition (diaphragm) at each joint. Each joint bears at its upper end a circle of leaves which are united to form a sheath, while their tips project as teeth, which are deciduous in some species, in others persistent. Branches, when present, are formed in whorls at the joints of the stem, which they resemble, except in the absence of the central canal; and these may be again branched. The stems are either perennial and evergreen or annual. The fructification, borne either by the vegetative stems or by special fruiting stems, is a terminal conical structure whose central axis bears numerous angular, shield-shaped bodies (clypodas) attached by horizontal pedicels. Each clypeola bears from 6 to 9 sporangia, which open on their inner side and discharge their spores. The spores are spherical. The outer coat breaks into four slender, club-shaped filaments (elaters), which are attached to one side of the spore, and are coiled about it when moist, uncurling when dry. Their elasticity aids the discharge of the spores from the sporangia, and favors distribution. The germination of the spores results in irregularly lobed dioecious prothallia above ground. *Equisetum* is the only genus. See cut in preceding column.

This genus, although now of little importance, was once most widely distributed, and formed a very conspicuous portion of the flora of the earth, especially during the Carboniferous and Triassic periods. There is much difficulty in classifying the fossil *Equisetaceæ*, in consequence of the imperfect preservation of important portions of the specimens studied. By some authors the genus *Equisetites* is not admitted as having been clearly established. Some also retain the name *Equisetaceæ* (instead of *Calamariæ*) for the fossil order, as well as for the recent.

Equisetum (ēk-wi-sē'tum), *n.* [NL., < L. *equisetum*, *sarta*, *-satis*, < *equus*, a horse, + *sata*, *sarta*, a bristle.] A genus of plants, constituting alone the order *Equisetaceæ*. There are about 25 species known, of which 8 are found in Great Britain and 13 in North America, some being common to both countries. The cuticle abounds in silica, on which account the stems of some species are used for polishing wood and metal. *Equisetum hiemale*, the scouring rush, is best suited for this purpose, and is largely imported into England from the Netherlands. The species of *Equisetum* are popularly called *horsetails*. See cut in preceding column.

2. Pertaining to or dependent upon strict equity or justice; regarding or relating to abstract right in individual cases; applied in law to the administration of justice by courts of equity, and to the principles established and methods

of procedure practised by them; as, *equitable* rights or remedies; *equitable* rules or powers. See *equity*.

There is hardly a subject of litigation, between individuals, which may not involve those ingredients of fraud, accident, trust, or hardship, which would render the matter an object of *equitable*, rather than of legal, jurisdiction, as the distinction is known and established in several of the states.

A. Hamilton, *Federalist*, No. 1XX.

Equitable assets. (a) Property not leviable under execution, and only to be reached by interposition of a court of equity. (b) Property belonging to the estate of a decedent by law not subject to payment of his debts in course of administration, but voluntarily charged by the testator with payment of debts generally, or upon which equity fastens a trust for that purpose. — **Equitable conversion,** a transformation of a fund from real to personal or from personal to real, assumed in equity to have been made in order to secure the application to the succession to or administration of that fund of the principles which the intention of a testator or the rights of parties interested require. Thus, where a will imperatively directs real property to be sold and distributed as money, the court may treat the fund as equitably converted from the testator's death, although the executors neglect to make an actual conversion into money. — **Equitable defense or plea,** a defense or plea which, though it would not be available at common law, is available under the rules of equity.

Equity in Law is the same that the Spirit is in Religion, what every one pleases to make it. *Selden, Table Talk*, p. 46.

(b) The system of jurisprudence or body of doctrines and rules as to what is equitable and fair and what is not, by which the defects of, and the incidental hardships resulting from, the inflexibility of the forms and the universality of the rules of the common-law tribunals are corrected or remedied, and substantial justice is done. In the early history of the English people it was found, as society advanced, that many grievances arose which were not included in the classes of cases which the common law authorized the judges to take cognizance of. Hence it became customary for those who could not obtain redress in the courts, because no common law action appropriate to their grievance had been sanctioned, or because the common law, while equitable and fair in its general application, was unfair in its application to their particular case, to apply to the king in Parliament or in council for justice. Petitioners in such cases if it could be shown that there was no adequate remedy at law, or that the operation of the common law was unfair in its application to the particular case in hand, were referred to the chancellor (originally an ecclesiastic, the keeper of the king's conscience, who, after hearing the parties, required what was equitable and just to be done, under penalty of imprisonment, excommunication, etc.). Thus, the common-law remedy of collecting a debt by getting judgment and execution became established at a time when property consisted almost entirely of lands and goods; but as wealth increased, and appeared in the forms of intangible property, such as valuable rights in action, contracts, securities, patents, copyrights, etc., the chancellor would entertain a complaint (called a *bill in equity*) from a creditor, setting forth that he was unable to collect his judgment out of property that could be reached by legal process, and that the debtor had other property which ought to be applied in payment, and asking that the defendant be compelled to do what equity and good conscience required to be done. The chancellor (the Court of Chancery) could compel the debtor to assign his intangible property to a receiver, a mode of relief which the law had never conferred on a debtor the power to afford. Or if a creditor, to secure his demand, obtained from his debtor a deed which in terms was an absolute conveyance, and was proceeding to enforce it as if it were so intended, the Court of Chancery would entertain a complaint from the debtor offering to pay the debt, and asking to be allowed to redeem the land. The steady growth of the complexities of property and of business and social relations increased the cases requiring equitable remedies to supply the deficiency of common-law remedies, or equitable interference with the unreasonable enforcement of common-law rules, until the procedure in equity developed a substantive system of doctrines and remedies covering a great variety of subjects scarcely contemplated by the common law. In England and the United States the doctrines of the common law have now generally been subjected to the established modifications introduced by equity, and in many jurisdictions the two systems of rules thus merged and modified are administered by the same courts. This new system is generally known in the United States as the *code practice*, or the *new or reformed procedure*.

There is not . . . a single department of the law which is more completely fenced in by principle, or that is better limited by considerations of public convenience, both in doctrine and discipline, than *equity*. *Stear, Misc. Writings*, p. 540.

(c) The court or jurisdiction in which these doctrines are applied; as, a suit in *equity*. (d) An equitable right; that to which one is justly entitled; specifically, a right recognized by courts of equity which the common law did not provide for; as, the wife's *equity*, or her right, when her husband sought to enforce his common-law claim to reduce her property to his own possession, to have a portion of it settled on herself. (e) The remaining interest belonging to one who has pledged or mortgaged his property, or the surplus of value which may remain after the property has been disposed of for the satisfaction of liens. [U. S.] (f) A right or obligation incident to a property or contract as

between two persons, but not incident to the property or contract from its own nature. In this sense used in the plural. *Rapaly and Law-ence.*

(a) The right of a mortgagee or a pledger by absolute deed to redeem the property by paying the debt, even after forfeiture, but before sale under foreclosure, or unconditional transfer of title, or before this right is barred by statutes of limitation. (b) In conveyancing, in the United States, the ownership of or title to real property which is subject to a mortgage — sometimes simply called *equity*.

Equity side of the court, or equity term, in a court in which both equity and the common law are separately retained and administered, a session or a term in which causes in equity are heard, as distinguished from those in which common law causes are heard. — **Syn. 1.** Rectitude, fairness, honesty, uprightness.

2. *In geol.*, contemporaneous in origin; corresponding in position in the scale of rocks; as, the *equivalent* strata of different countries. See *II, 2*. — 3. *In geom.*, having equal areas or equal dimensions; said of surfaces or magnitudes. — 4. *In biol.*, having the same morphological value; homologous in structure. — **Calculus of equivalent statements.** See *calculus*.

II. n. 1. That which is equal in value, measure, power, force, import, or meaning, to something else; something that corresponds, balances, compensates, etc.

[Some men] fancy a regular obedience to one law will be a full *equivalent* for their breach of another. *Boswell.*

2. In *geol.*, a stratum or series of strata in one district formed contemporaneously with a stratum or series of a different lithological character in a different region, or occupying the same relative position in the scale of rocks, and agreeing in the character of its fossils if deposited under similar circumstances; thus, the Caen building-stone of France is the *equivalent* of the English Bath oolite. — **Endosmotic equivalent.** See *endosmosis*. — **Law of equivalents.** In *chem.*, the law that the several combining weights of any number of bodies which form compounds with each other body are either the same or simple multiples of the combining weights of these several bodies when they form compounds with one another. Thus, if a body A unite with other bodies B, C, D, then the quantities B, C, D, the letters being used to denote the combining quantities as well as the bodies which unite with it, or some simple multiples of these quantities, represent for the most part the proportions in which they unite among themselves. The various quantities A, B, C, D (or multiples of them) are termed the *equivalents* of one another. Thus 1 part by weight of hydrogen unites with 8 parts by weight of oxygen to form water, with 35.5 of chlorine to form hydrochloric acid, with 16 of sulphur to form sulphuric acid; these quantities or their multiples are therefore regarded as equivalents of one another, 8 parts of oxygen uniting with 35.5 of chlorine to form chlorine monoxide (Cl₂O), and 16 of sulphur with 8 + 2 of oxygen to form sulphurous acid (SO₂). When the atomic weights are taken into account (H = 1, O = 16, S = 32, Cl = 35.5), it is seen that one atom of hydrogen is the combining equivalent of one of chlorine, and two atoms of hydrogen of one of oxygen and one of sulphur; and taking the quantitative of hydrogen as unity, chlorine is *equivalent*, oxygen and sulphur are *bivalent*. Upon this equivalency or quantitative of the different elements is based their classification into *monads*, *dyads*, *triads*, *tetrads*, etc., and accents (sloping strokes) are frequently appended to the symbols in formulae to show to which class the bodies belong, as H₂O, N⁺H₄, C⁺⁺H₄ or C⁺⁺H₄. — **Mechanical or dynamic equivalent of heat.** In *physics*, the amount of mechanical energy which is equivalent to (that is, which when transformed into heat will produce) one heat unit. This constant quantity has been determined in several ways. The first accurate experiments were by Joule, who measured the amount of heat produced by the friction of a paddle-wheel in a vessel of water, the energy required to turn the paddle being supplied by a known weight descending through a known distance. Joule found that to raise one pound of water 1° F. (heat unit), 772 foot-pounds of mechanical work were required, and to raise it through 1° C., 1,369 foot-pounds. This constant is often called *Joule's equivalent*. See *heat*. — **Morphological equivalents.** The similar forms which occur in different genetic series having a common origin, and probably due to similar causes. *A. Huxley.*

Cf. *energy*.] In *physics*, the unit of work in the centimeter-gram-second system—that is, the amount of work done by the unit of force, one dyne, acting through the unit of distance, one centimeter. One foot-pound is approximately equal to 1.356 × 10⁷ ergs, and one horse power (English) is equal to 7.46 × 10⁸ ergs per second. Also *ergon*.

We request that the word *ergon*, or *erg*, be strictly limited to the C. G. S. unit of work, or what is, for purposes of measurement, equivalent to this, the C. G. S. unit of energy. *J. D. Everett, Units and Phys. Const.*, p. 167.

ergot¹ (ér'got), *n.* [< F. *ergot*, also *argot*, a spur, the extremity of a dead branch, in bot. ergot; origin unknown.] 1. In *farreria*, a stub, like a piece of soft horn, of about the size of a chestnut, situated behind and below the pastern-joint, and commonly hidden under the tuft of the fetlock.—2. A morbid growth arising from a diseased condition of the ovary of various grasses, caused by a fungus of the genus *Claviceps*. The growth of the fungus begins by the formation of a filamentous mycelium upon the surface of the ovary, which it destroys and displaces, retaining approximately its shape. The surface of this tissue is marked by furrows. At this stage conidia are produced upon the tips of short hyphae; and in this form it was formerly considered a distinct species, under the generic name *Sphaeria* (which has become a common name co-ordinate with *Sclerotium*). When the formation of conidia is at its height, a thick belt of more compact hyphae is formed at the base of the mass. This assumes a dark-violet color, and continues to grow, pushing upward the sphaecelia, which is torn from its attachments, and soon falls off.

1. Cross-section of the ovary sphaecelia, in the early stage of the fungus, showing the mycelium *a a a*, conidiophores *b b b*, and conidia *c c c*. 2. Ergot on its supporting grass. 3. Fully developed ergot (a), bearing the furrowed remains of the ovary (b). 4. Ergot which has produced 7 stromata. 5. Longitudinal medial section of a stroma, showing the numerous perithecia just beneath the surface. 6. Longitudinal medial section of a perithecium, showing the slender ascus arising from the base. 7. An isolated ascus from which the filiform spores are escaping. (Figs. 2, 3, and 4 somewhat reduced; 5, magnified; 1, 6, and 7, highly magnified.)

The resulting structure is the *sclerotium* or *ergot*. It is a horn-like mass, often one inch in length. It lies dormant till full or usually till the following spring, when branches arise in a tuft. Each becomes a stroma, consisting of a stalk and a small head. In the head are formed a number of flask-shaped perithecia, each containing many asci, of which each in turn incloses several filiform spores. The ergot of rye is caused by *Claviceps purpurea*. Ergot is said to cause a sort of gangrene in cattle, especially in the feet. It is used in medicine to cause contraction of the uterus and of the arterioles and as an abortifacient, and also in certain morbid states of the cerebro-spinal axis, where its effect may or may not be due entirely to its action on the vessels. Also called *spurred rye*.

3. In *anat.*, the calcareous spur, or hippocampus minor of the brain. [Rare.]

Error is . . . a mistake of our judgment, giving us to see that which is not true.

In my mind he was guilty of no *error*, he was chargeable with no exaggeration, he was betrayed by his honey into no metaphor, who once said, that all we see about us, King, Lords, and Commons, the whole machinery of the state, all the apparatus of the system, and its varied workings, end in simply bringing twelve good men into a box. *Brougham*.

There is but one effective mode of displaying an *error*, and that is to replace it by a conception which, while readily adjusting itself to conceptions firmly held on other points, is seen to explain the facts more completely. *G. H. Lewis, Probs. of Life and Mind, Int. I, § 6*.

5. The difference between the observed or otherwise determined value of a physical quantity and the true value; also called the *true error*. By the *error* is often meant the error according to some possible theory. Thus, in physics, the rule is to make the sum of the squares of the errors a minimum—that is, that theory is adopted according to which the sum of the squares of the errors of the observations is represented to be less than according to any other theory. The *error of an observation* is separated into two parts, the *accidental error* and the *constant error*. The accidental error is that part of the total error which would entirely disappear from the mean of an indefinitely large series of observations taken under precisely the same circumstances; the constant error is that error which would still affect such a mean. The *law of error* is a law connecting the relative magnitudes of errors with their frequency. The law is that the logarithm of the frequency is proportional to the square of the error. This law holds only for the accidental part of the error, and only for certain kinds of observations, and to those only when certain observations affected by abnormal errors have been struck out. The *probable error* is a magnitude which one half the accidental errors would in the long run exceed; this is a well-established but unfortunate expression. The *mean error* is the quadratic mean of the errors of observations similar to given observations.

6. In *law*, a mistake in a judicial determination of a court, whether in deciding wrongly on the merits or ruling wrongly on an incidental point, to the prejudice of the rights of a party. It implies without imputing corruptness, a deviation from or misapplication of the law, of a nature sufficiently serious to entitle the aggrieved party to carry the case to court of review.

7. Perplexity; anxiety; concern.

He . . . thought well in his courage that they were right high men and greater of estate than he could think, and a doubt his heart was so great *error* that it wote all his visage with tears of his eyes. *Melville (E. T. S.), ii. 318*.

escapement (es-kap'ment), *n.* [*< OF. *escapement, escapement, échappement, F. échappement = Sp. escapamento = It. scampamento; as escape + -ment.*] 1t. The act of escaping; escape.—2. The general contrivance in a timepiece by which the pressure of the wheels (which move always in one direction) and the vibratory motion of the pendulum or balance-wheel are accommodated the one to the other. By this contrivance the wheelwork is made to communicate an impulse to the regulating power (which in a clock is the pendulum and in a watch the balance wheel), so as to restore to it the small portion of force which it loses in every vibration, in consequence of friction and the resistance of the air. The leading requisite of a good escapement is that the impulse communicated to the pendulum be invariably, notwithstanding any irregularity or looseness in the train of wheels. Various kinds of escapements have been contrived, such as the *crown* or *verge-escapement*, used in common watches, and the *anchor* or *crutch-escapement*, in common clocks. Both also termed *recoiling escapements*; the *dead-beat escapement* and the *gravity* or *remontant escapement*, used in the finer kind of clock. The *horizontal escapement* or *cylinder escapement*, the *detached escapement*, the *lever-escapement*, the *duplex escapement*, the *pinwheel escapement*, all used in the finer classes of watches, and the *half dead escapement*, in which there is a slight recoil. In the horizontal escapement the teeth of a horizontal wheel act upon a hollow cylinder on the axis of the balance, to give the impulse.

Nouns in *-ese* (which are much oftener used in the plural than in the singular) are sometimes popularly regarded as plurals in *-s*, and give rise to singulars like *Chinese*, *Portuguese*. With reference to language, this suffix is sometimes used humorously with the name of a person, as in *Johnsonese*, *Carlylese*, etc., the language or style of Mr. Johnson, Carlyle, etc. In *burghese* the suffix, of earlier introduction, is shortened; in *bourgeois*, of recent introduction, it retains the French form.

A shield-bearer or armor-bearer; an armiger; an attendant on a knight. See *squire*², 1.—2. A title of dignity next in degree below that of *knight*. In England this title is properly given to the eldest sons of knights and the eldest sons of the younger sons of noblemen and their eldest sons in succession, officers of the king's courts and of the household, barristers, justices of the peace while in commission, sheriffs, gentlemen who have held commissions in the army and navy, etc. There are also esquires of knights of the bath, each knight appointing three at his installation. The title is now usually conceded to all professional and literary men. In the United States the title is regarded as belonging especially to lawyers. In legal and other formal documents *Esquire* is usually written in full after the names of those considered entitled to the designation; in common usage it is abbreviated *Esq.* or *Esqr.*, and appended to any man's name as a mere mark of respect, as in the addresses of letters (though this practice is becoming less prevalent than formerly). In the general sense, and as a title either alone or prefixed to a name, the form *Squire* has always been the more common in familiar use. See *squire*.

1 am Robert Shallow, sir; a poor esquire of this county, and one of the king's justices of the peace.

Shak., 2 Hen. IV., iii. 2.

Esquires and gentlemen are confounded together by Sir Edward Coke, who observes that every esquire is a gentleman, and a gentleman is defined to be one qui arma gerit, who bears coat-armour, the grant of which was thought to add gentility to a man's family. It is indeed a matter somewhat unsettled what constitutes the distinction, or who is a real esquire; for no estate, however large, per se confers this rank upon its owner.

1 Brown and Had. Com. (Wait's ed.), p. 317.

The office of the esquire consisted of several departments; the esquire for the body, the esquire of the chamber, the esquire of the stable, and the carving esquire; the latter stood in the hall at dinner, carved the different dishes, and distributed them to the guests.

Strutt, Sports and Pastimes, p. 10.

It makes an important practical difference to an Englishman, by the way, whether he is legally rated as *Esquire* or "Gentleman," the former class being exempt from some burdensome jury duties to which the latter is subject.

The *essays* is properly a collection of notes, indicating certain aspects of a subject, or suggesting thought concerning it, rather than the orderly or exhaustive treatment of it. It is not a formal treatise, but a series of assaults, essays, or attempts upon it. The inward nature, true substance, or constitution of anything. The Greek *οὐσία* (see the etymology) denotes a subject in *esse*, something whose mode of being corresponds to that of a subject, as distinguished from a predicate, in speech. But while this is the original conception, the word *essence*, even in Latin, usually carries a different sense. The *essence* is rather the idea of a thing, the law of its being, that which makes it the kind of thing that it is, that which is expressed in its definition. In regard to artificial things, the conception of an *essence* is usually tolerably clear; thus, the *essence* of a bottle is that it should be a vessel with a tubular orifice. Those philosophers who speak of the *essences* of natural things hold that natural kinds are regulated by similar ideas. Nominalists hold that definitions do not belong to things, but to words; and accordingly they speak of the *essences* of words, meaning what is directly implied in their definitions.

Justice in her very *essence* is all strength and activity.

Milton, Eikonoklastes, xxviii.

First, *essence* may be taken for the being of anything, whereby it is what it is. And thus the real internal, but generally in substances unknown, constitution of things, whereon their discoverable qualities depend, may be called their *essence*. . . . Secondly, . . . but, it being evident that things are ranked under names into sorts or species only as they agree to certain abstract ideas, to which we have annexed those names, the *essence* of each genus or sort comes to be nothing but that abstract idea which the general or sortal it I may have leave so to call it from sort, as I do general from genus name stands for. And thus we shall find to be that which the word *essence* imports in its most familiar use. These two sorts of *essence*, I suppose, may not nimbly be termed, the one the real, the other the nominal, *essence*.

Locke, Human Understanding, III, iii, 15.

Whatever makes a thing to be what it is, is properly called its *essence*. Self-consciousness, therefore, is the *essence* of the mind, because it is in virtue of self-consciousness that the mind is the mind—that a man is himself.

Essenes (es'senz'), *n. pl.* [Formerly also *Essens*; *< LL. Esseni, < Gr. 'Essōnoi, also 'Essaioi*, the Essenes. The origin of the name is unknown. See *Issidean*.] A community of Jews in Palestine formed in the second century B. C., originally representing a tendency rather than constituting an organized sect, and aiming at a higher degree of holiness than that attained by other Jews. Later they were organized into a sort of monastic society, bound together by oaths to piety, justice, obedience, honesty, and secrecy. According to Philo, their conduct was regulated by three rules—"the love of God, the love of virtue, and the love of man." They rejected animal sacrifices, but were strict in their observance of the non-Levitical Mosaic law. They were ascetics and generally celibates. They never extended, as a body, beyond the bounds of Palestine, and disappeared after the destruction of Jerusalem.

Bp. Chr. Wordsworth, Church of Ireland, p. 295.

The church is accepted by the state as the religious body in England which is the legitimate possessor of all property set apart and devoted to religious uses, except the rights of some other religious body be specially expressed. . . . Its rights are carefully guarded by law. . . . This position of the church towards the state is called its Establishment. 5. In law: (a) The legal position or status of an owner, considered with respect to his property: ownership, tenancy, or tenure: property in land or other things. When the thing in question is an immovable, such as land, etc., the estate, if a fee, or for a life or lives, is termed *real*. (See *real*.) If it is only for a term of years, or relates only to movables, it is termed *personal*.

Land was once not regarded as property at all. People owned not the land, but an *estate* in the land; and these *estates* still continue to haunt, like ghosts, the language of real property law.

Sir J. F. Stephen, National Rev., Laws relating to Land.
(b) More technically, and with relation only to land, the degree or quantity of interest, considered in respect to the nature of the right, its period of duration, or its relation to the rights of others, which a person has in land. If that interest, in a given case, does not amount to an absolute entire ownership, it is because there is at the same time another interest in the same thing pertaining to other persons. Thus, one man may have the ultimate right of property, another the right of possession, and a third actual possession: each of these interests being *qualified* or *incomplete estates*, which, if transferred to and merged in one person, would constitute an *absolute estate* or *fee simple*. (See *fee simple*.) Such special estates are said to be carved out of the fee. A *future estate*—that is, one which is not to be enjoyed until a future time—is nevertheless deemed to have a present existence in anticipation, even if it may never take effect, or if it is wholly uncertain who will be its owner; it is, in such case, called a *contingent estate*. N. Y. Rev. St., III, 2175, § 5.

The grant of land to a man, without specifying what *estate* he is to take, will to this day give him no interest beyond his own life.

F. Pollock, Land Laws, p. 55.

6. Property in general; possessions; particularly, the property left at a man's death: as, at his death his *estate* was of the value of half a million; the trustees proceeded to realize the *estate*.

Bacon, Essays.

9. One of the orders or classes into which the population of some countries is or has been divided, with respect to political rights and powers. In modern times this division has been into nobility, clergy, and people now, in Great Britain, lords temporal and spiritual and commons: called the *three estates*. Formerly in France a legislative assembly representing the three estates called the *states-general*, was summoned only in emergencies, the last being the revolution of 1789.

When the crowned Northman consulted on the welfare of his kingdom, he embodied these *estates* of his realm. Now an *estate* is a class of the nation invested with political rights. There appeared the *estate* of the clergy, of the barons of other classes. In the Scandinavian kingdom to this day the *estate* of the peasants sends its representatives to the diet.

Hornbush.

The United Kingdom of Great Britain and Ireland is governed by its king or queen and two Houses of Parliament. These are commonly known as the 'Three *Estates*' of the Realm; but this phrase properly applies to the three classes of which Parliament is composed, viz., the Lords Spiritual, the Lord Temporal, and the Commons.

Cap of estate. Same as *cap of maintenance* (which see, under *cap of maintenance*).—Cloth of estate. See *cloth*.—Conditional estate, or estate upon condition, an estate the existence of which depends upon the happening or not happening of some uncertain event, whereby the estate may be either originally created or enlarged, or finally defeated. Blackstone. See *condition*.—Conventional estates. See *conventional*.—Convention of estates. See *convention*.—Equitable estate or title, a right to claim the profits or enjoyment of ownership from the person who holds the legal title as trustee; a beneficial interest, recognized by courts of equity as belonging to one person, while the legal title—that is, the title recognized by courts of common law—is in another person. Thus, sometimes a trustee is said to hold the legal title to the trust property, and the beneficiary an equitable estate or title. Estate at will, that estate held by one who is in possession of the land of another by his consent, and holds it at the will of the latter, or at the will of both parties. Estate by statute. See *statute*.—Estate by sufferance. See *sufferance*.—Estate by the courtesy. See *courtesy of England* (under *courtesy*).—Estate for life, an estate limited to a man to hold the same for the term of his own life, or for that of any other person, or for more lives than one. (Stephen.) When used without qualification, the phrase usually implies tenancy for one's own life. Estate for years, an estate which, by the terms of its creation, is measured by the lapse of a specified period of time (it may be a fraction of a year or more), so that it must expire by a certain date. An estate for years is often called a *term*.—Estate in common. See *tenancy*.—Estate in expectancy. See *expectancy*.—Estate in fee. See *fee*.—Estate in joint tenancy, an estate held, whether in fee, for life, for years, or at will, by several persons jointly (as distinguished from an estate in *severalty*, or held separately). Its characteristics are that it was created as a single estate, in which the owners were conjoined (*unity of estate*), and must therefore owe its origin to one act or deed (*unity of title*), the interest of each commencing at the same time (*unity of time*), and the possession of either being legally equivalent to the possession of all (*unity of possession*). It follows from these qualities that on the death of one the entire estate remains in the others, who are said to take by *right of survivorship*. A conveyance by one of his interest terminates the joint character of the interest conveyed, because the unities are not preserved, and the transferee, if a stranger, is a tenant in common. To illustrate the distinction, trustees hold as joint tenants, heirs as tenants in common. See *tenancy*.—Estate in possession. See *possession*.—Estate in severalty. See *severalty*.—Estate in tail, an estate in fee cut down (*tail*) by restricting it to certain descendants or classes of descendants, leaving usually a right of reversion in the creator of the estate, in the event of the failure of such descendants. See *tail* and *entail*.—Estate of inheritance, an estate that on the death of the owner survives, and if he dies intestate passes to his heirs. Vested estate, an estate in which there is an immediate right of present enjoyment or a present fixed right of future enjoyment, or in regard to which, if all precedent estate should instantly terminate, the right to enjoyment would immediately be in an existing person. Syn 1 and 2. Estimate, Esteem, Estimation, Respect, Regard; honor, admiration, reverence, veneration. *Estimate*, both as noun and as verb, supposes an exercise of the judgment in determining external things, as amount, weight, size, value; or internal things, as intellect, excellence. It may be applied to that which is unfavorable as, my *estimate* of the man was not high. *Esteem* as a noun has commonly the favorable meanings of the verb, it is a moral sentiment made up of respect and

attachment, the result of the mental process of reckoning up the merits or useful qualities of a person; as, he is held in very general esteem. *Estimation* has covered the meanings of both *estimate* and *esteem*. *Respect* is commonly the result of admiration and approbation; as, he is entitled to our respect for his abilities and his probity; it omits, sometimes pointedly, the attachment expressed in *esteem*. *Regard* may include less admiration than *respect* and be not quite so strong as *esteem*, but its meaning is not closely fixed in quality or degree.

3. In a special metaphysical use, existing outside of all relations of time; independent of all time-conditions; not temporal.

For there were no days and nights and months and years before the heaven was created, but when he created the heaven he created them also. All these are the parts of time, and the past and future are created species of time, which we unconsciously but wrongly transfer to the eternal essence; for we say indeed that he was, he is, he will be, but the truth is that "he is" alone truly expresses him, and that "was" and "will be" are only to be spoken of generation in time.

Plato, *Timæus* (trans. by Jowett), § 38.

4. By hyperbole, having no recognized or perceived end of existence; indefinite in duration; perpetual; ceaseless; continued without intermission.

Elegant, *Sella*.

Eternal generation, in *theol.*, the communication of the divine essence from God the Father to God the Son. The Catholic, orthodox, or Trinitarian doctrine is that God the Son, being truly God equally with God the Father, is existent from all eternity to all eternity, and that accordingly God has always existed as Father and as Son, so that the divine act of generation is itself eternal, that is, never had a beginning and can never have an end. This doctrine is opposed to the Arian teaching that "there was a time" when he [the Son] was not, and that "before being begotten he was not." As involving eternity and filiation, the act by which the Son proceeds from the Father is distinctively called *begetting* or *generation*, while that by which the Holy Ghost proceeds from the Father (according to John xv. 26 and the terminology of the Eastern Church), or from the Father and the Son (in the language of Western theology), is called *proceeding* simply, or distinctively *spiration*. = *Syn. Eternal*, *Everlasting*, *Immortal*, *Perpetual*; interminable, perennial, imperishable. *Eternal* primarily means without beginning or end, but secondarily without end; *everlasting* properly means lasting from the present to an endless future. Both *eternal* and *everlasting* are peculiarly associated with the divine being or function. *Immortal* applies to that which cannot or will not die; as, "immortal hate," *Milton*, *P. L.*, l. 104; "married to immortal verse," *Milton*, *L'Allegro*, l. 137. It is sometimes applied to God (1 Tim. i. 17). *Perpetual* points to the future, and applies especially to that which is established; as, a perpetual covenant, desolation, feud. It is freely applied to anything that lasts indefinitely. All the four words are often used by hyperbole for that which has long duration. See *incessant*.

What can it then avail, though yet we feel
Strength undiminish'd, or eternal being,
To undergo eternal punishment?

ethics (ēth'iks), *n.* [*Pl. of ethic (see -ics), after Gr. τὰ ἠθικά, neut. pl., ἡ ἠθική, fem. sing., ethics; see ethic.*] **1.** The science of right conduct and character; the science which treats of the nature and grounds of moral obligation and of the rules which ought to determine conduct in accordance with this obligation; the doctrine of man's duty in respect to himself and the rights of others. Kant distinguishes between pure morals, or the science of the necessary moral laws of a free will, and *ethics* properly so called, which considers those laws under the influence of sentiments, inclinations, and passions to which all human beings are more or less subject.

This fable seems to contain a little system of morality; so that there is scarce any better invention in all *ethics*.

Bacon, *Fable of Dionysius*.

Ethics may either be regarded as an inquiry into the nature of the Good, the intrinsically preferable and desirable, the true end of action, &c.; or as an investigation of the Right, the true rules of conduct, duty, the Moral Law, &c. *H. Sidgwick, Methods of Ethics*, p. 2.

Professor Birks came nearer a satisfying definition when he said that *Ethics* is the science of ideal humanity—the only objection to it being that it does not necessarily imply self-determination and obligation.

New Princeton Rev., I, 153.

Ethics, taken in its proper signification, includes two things. On the one hand, it consists of an investigation into the nature and constitution of human character; and, on the other hand, it is concerned with the formulating and enjoining of rules for human conduct.

The Ethiopians of Homer are mythical; later the term came to imply a negro, a blackamoor, and popular etymology, followed by modern writers, derived the name from αἶθρ, burn (or αἶθρ, burnt), + ὤψ, eye, face; as if 'the Burnt-Faces' (cf. αἶθρ, fiery-looking, flashing, sparkling, fiery, hot, in L. Gr. also swart, black, < αἶθρ, burnt, fiery, + ὤψ, face); but the form Αἰθίοψ would not result from such composition, and it is probably a corruption of some Egyptian or African original.] **1.** An inhabitant of ancient Ethiopia; an Ethiopian.—**2.** In a wider sense, in both ancient and modern times, an African; a negro.*

See *I*.—**2.** Specifically, pertaining to the ethmoid: as, the *ethmoid* region of the skull.

II. n. A bone of the cranium, situated in the middle line of the skull, in advance of the sphenoid, above the basiscranial axis, transmitting the filaments of the olfactory nerve, and constituting the bony skeleton of the organ of smell: so called because, in the human subject and mammalia generally, it has a cribriform plate perforated with numerous holes for the passage of the olfactory nerves. The human ethmoid is comparatively small, of a cubical figure, with its cribriform plate horizontal. It consists of a median perpendicular plate or mesethmoid, and of the horizontal or cribriform plate, from which latter the main body of the bone depends on either side, forming the so-called lateral masses, or ethmoturbinals. The texture of these is extremely light and spongy, full of large cavities connecting with the frontal and sphenoidal sinuses, and lined with mucous membrane, the Schneiderian membrane, upon which the olfactory nerves ramify after leaving the cavity of the cranium through the holes in the cribriform plate. (See cut under *nasal*.) The so-called *placina* of the ethmoid is simply the exterior surface of these lateral masses, which contributes to the inner wall of the orbit of the eye. The lateral masses are each partly divided into two, called the superior and middle turbinate bones, or scroll-bones (the inferior turbinate being a different bone), which respectively overlie the corresponding nasal meatuses. (See cut under *nasal*.) The ethmoid is wedged into the ethmofrontal notch of the frontal bone, and also articulates with the vomer, sphenoid, sphenoidal ossicles, maxilla, maxillaries, lacrymals, palatals, and maxillatubercles. It is developed from three osseous centers, one for the perpendicular plate, and one for each lateral mass.

In other animals the ethmoid exhibits a wide range of variation in size, shape, and connections, and below mammals loses much or all of the particular characters it presents in man. (See cut under *Esoe*.) It is relatively larger and more complicated in mammalia of keen scent, as carnivores and ruminants.

ethmoidal (ēth-moi-dal), *a.* [*< ethmoid + -al.*] Pertaining to the ethmoid. = **Anterior ethmoidal canal**, a canal formed from a groove on the anterior part of the ethmoidal edge of the orbital plate of the frontal bone by articulation with the ethmoid. It transmits the nasal branch of the ophthalmic nerve and the anterior ethmoidal vessels. = **Ethmoidal foramina**. See *cut under*.

Etruscan (ē-trus'kan), *a.* and *n.* [*< L. Etruscus*, Etrurian (pl. *Etrusci*, the Etrurians), *< Etruria*, Etruria. Hence ult. *Tuscan*, *q. v.*]

1. *a.* Pertaining or relating to Etruria, an ancient country in central Italy, bordering on the part of the Mediterranean called the Tyrrhenian sea, between Latium and Liguria (including modern Tuscany), or to its inhabitants, and especially to their civilization and art. These, before Hellenic influence was actually felt in Etruria, resembled in many ways those of primitive Greece. Compare *Tuscan*.—**Etruscan art**, the art of ancient Etruria; an artistic development believed with probability to have grown up independently from the same root as the art of Greece, but far inferior in every way to Greek art, though in its later stages influenced by it. Etruscan masonry closely resembles the Greek in its progress from the massive polygonal to admirable rectangular work in even courses; the arch and the vault were consistently employed, and were passed on to become the characteristic feature of Roman architecture; while the Etruscan house of rectangular plan with central court was the prototype of the Roman house. (See *Tuscan order*, under *Tuscan*.)

Etruscan Art.—Etruscan Sarcophagus in terra-cotta, from Chiusi: period of full development.—Musée Egizio, Florence.

The best works of Etruscan sculpture were its strongly colored terra-cotta statues, of life-size and larger, and its sarcophagi of terra-cotta bearing reclining figures on their lids, showing, however, but little anatomical truth, despite much research in details of dress and ornament. The native Etruscan jewelry exhibits massiveness and intrinsic value, as in heavy and complicated chains, pendants, and the like, in preference to the delicacy and artistic refinement of the imported Greek and Phœnician examples found with the native productions in the tombs. See *bulbæ*.—**Etruscan pottery**. (a) The pottery of the ancient Etruscans, which may be roughly divided into four main classes: (1) the early cinerary urns, called *Urnæ cinerariæ*, with covers in the form of human heads (see *Campio*); (2) the black, unglazed ware, with ornamental figures and designs, impressed or in low relief, called *bucchero* or *bucchero nero* (see *bucchero*); (3) the painted vases imitated more or less closely from those of Greek manufacture; (4) the vases coated with a brilliant black varnish, and bearing reliefs, called *Etrusco-Campanian* (which see). (b) An epithet erroneously applied to Greek painted vases. This application, originating in the eighteenth century, before the study of archaeology had made much advance, is still in use among persons whose ideas about these subjects are obtained from books. Wedgwood had this use in mind when he named his works *Etruria*.—**Etruscan ware**, a pottery made by a person named Billwyn, at Swansea in Wales, about 1850, and decorated with figures, borders, etc., of classical design, usually in black or red. This ware was known as *Dillwyn's Etruscan ware*, and these wares were printed in black on the bottom of each piece. *Jewitt*.

II. *n.* 1. An inhabitant of Etruria; a member of the primitive race of ancient Etruria.

The Etruscans were distinguished ethnologically from all neighboring races, and their affinities are unknown, though they were similar people in ancient Etruria, Thracia, etc. They called themselves *Etrusci*, and the Greeks called them *Tyrrhenians*, between which and *Etruscans* there is probably a philological connection. See *Tyrrhenian*.

2. The language of the Etruscans, which from its few remains appears to have been unlike any other known tongue. It was spoken by many people in Italy outside of Latium, till gradually superseded by Oscan and Latin; but a form of it continued in use in Etruria (the Grisons and Tyrol) several centuries longer.

Etrusco-Campanian (ē-trus'kō-kam-pā'ní-an), *a.* Pertaining to Etruria and Campania, of ancient Italy.—**Etrusco-Campanian pottery**, the latest class of Etruscan pottery, made also in Campania, in the third century B. C. and later. The vases of this class are coated with a brilliant black varnish, present a great diversity of forms, and, like the older *bucchero* vases, affect shapes more appropriate to metal than to clay. All bear ornament in relief, from simple ribs or flutings to medallions, groups of figures, etc.

Etrusco-Campanian Vase.

The leaves are thick and smooth, mostly similar on both sides, and thrown into a vertical position by a twist of the petiole, glandular-punctate, and with a strong, peculiar odor. The matured wood is always hard, and the timber is of ten very valuable. Many of the arboreal species are very tall; and some, as *E. amygdalifolia* and *E. drevesii*, reach a height of over 100 feet, exceeding in this respect all other known trees. Many species exude a gum (a kind of kino), whence the common

The leaves of various species, especially of *E. globulus*, and the oil extracted from them, are said to have important remedial powers in asthma, bronchitis, and various other diseases. The trees are of very rapid growth, and several species, especially the blue-gum, *E. globulus*, have been extensively planted in warm countries for their timber. Euchone (ū-kō-nē), *n.* [NL., < Gr. *eu*, well, + *χων*, a funnel.] A genus of tubicolous annelids, of the family *Terebellidae*. *E. elegans*, a beautiful worm of the New England coast, builds a slender tube covered with fine sand, from which it protrudes its long branchial like a spreading flower.

euchre (ū'kēr), *n.* [Sometimes written *eucre*; the spelling is evidently corrupt. If of G. origin, as sometimes said (with some probability; cf. *bar-cro* in this game, of G. origin), it would perhaps represent a LG. form **juker*, but no connection is made out. Cf. G. *jucks*, a joke (= E. *joke*), with E. *joker*, a certain card; LG. *juch-hei*, a merry company, an exclamation of boisterous joy, = MHG. *juch*, > G. *juchzen*, shout.] 1. A game of cards played by two, three, or four persons with the 32, 28, or 24 highest cards of the pack. Five cards are dealt to each player, two and then three at a time, or three and then two, and one to mark trumps is turned face up; the eldest hand has the right either of ordering this card into the dealer's hand, who discards another, and then playing the game, or of "passing"—that is, doing nothing; likewise the second and third hands if more than two play; should all pass, the dealer can take up into his hand the trump card, or can pass, which he does by turning down the card which had been turned face up; if the latter, the eldest hand either names a new suit as trumps, the game being then played through, or passes again. Should he pass, the second hand, the third hand, and the dealer in turn have the same right of naming the trump or passing. If all pass on this second round, then a new deal is made by the hand next in order. In playing the hands, each player throws one card, following suit if possible, and the highest card takes the trick; the winning of three tricks counts one, of five tricks two; should a player on one side order up, take up, or name the trump and fail to secure at least three tricks, that side is euchred, and its opponent scores two. The cards rank from ace through king, queen, etc., to the lowest card used, except in trumps, where the knave, known as the right bower, is the highest, and the other knave of the same color, or left bower, is the next highest. Sometimes an additional card, called the *joker*, which is the highest of all the cards, is used, the game being then known as *rail-road euchre*.

2. The winning of at least three tricks in a hand, in a game of euchre, from the side which makes the trump; as, that is a *euchre*.—**Cut-throat euchre**, three-handed euchre, in which one person plays against the other two together.—**French euchre**, a variety of the game of euchre played by four persons with the 24 highest cards of the pack. Each player, in turn, has the right of bidding, or offering to take a certain number of tricks, and that one who bids highest names the trump. The game then proceeds as in four-handed euchre. If the bidding player and his partner take the number of tricks proposed, they add that to their score; if not, their opponents do. **Progressive euchre**, a series of games of euchre played by three or more sets of four persons each. All the sets begin playing at the same time, and when those at the first or "head" table finish, those at the other tables must stop playing. Those who win or are ahead score one, and are advanced to the next table, except those already at the head table, who stay where they are. Those who lose or are behind stay where they are, except when at the first table, in which case they go back to the last or "body" table. All who lose while at the last table score one as "boobies." At the end of the play prizes are given.

Six-handed or bid euchre, a variety of the game of euchre played by six persons (three on a side), with the joker and the 29, 32, or 34 highest cards of the pack. That player who bids or offers to make the most points names the trump. The game then proceeds as in four-handed euchre. If the player who bids and his partners secure the number of points proposed, they add it to their score; if not, it is counted for their opponents. When more than 30 cards are used, those not dealt are placed face-down on the table, and are called "the widow"; the player who names the trump has the privilege of selecting such of them as he may wish, and using them in place of others discarded from his hand.

euchre (ū'kēr), *v. t.*; pret. and pp. *euchred*, ppr. *euchring*. [(< *euchre*, *n.*)] In the game of euchre, to win a hand over, when an opponent has ordered up, taken up, or named the trump, thus securing two points; hence, to turn the tables on; defeat; get the better of. See the noun.

2. Of or pertaining to Euclid, or Eukleides, Archon Eponymous of Athens for the year 403 B. C. Euglenidae (ū-jē-ni-ā-dē), *n. pl.* [NL., < *Euglena* + *-idae*.] A large family of monostigmatous eumastigote flagellate infusorians, typified by the genus *Euglena*, highly diversiform or metabolic, with brilliant, usually green, endoplasm.

These remarkable animalcules form a natural family, whose bright colors (for the most part green, though sometimes red) and peculiar endogenous multiplication (noted below) are highly characteristic. They vary much in the different genera, being free-swimming or sedentary, naked or loricate, and solitary or colonial. The flagellum is single and terminal; the oral aperture is distinct; the endoplasm often contains highly refractive particles of apparently amorphous substance; one or more eye-like pigment specks are often developed at the anterior end; and the contractile vacuole and the endoplast are conspicuous, the former usually located close to the anterior border. The euglenids multiply both by longitudinal and transverse fission, by the subdivision of the body-substance into spindling elements, and by the development of independent germinal bodies out of the substance of the endoplast. The sporulation, or breaking up of the colored endoplasm, usually consequent upon a process of encystment, results in the formation of germs variable in number and of irregular contour, released as small green amoebiforms, without trace of the flagellum, oral aperture, or pigment spot, which are subsequently acquired. The fusiform zooids resulting from the sporulation of the endoplasm of mottled euglenids, on the contrary, appear to be usually furnished with flagellum and an eye-speck. Another form of encystment, not connected with reproduction, occurs in euglenids when the water dries up in the ponds or ditches where they live. The animalcules become spherical and quiescent, develop gelatinous covering which indurates, and in this condition have been mistaken for green algae. These several changes of the animalcule give rise to the term *euglenoid*, applied to other organisms, as gregarines, which present similar conditions of encystment and sporulation. According to Saville Kent, the genera composing the family as at present recognized are *Euglena*, *Amblophos*, *Phacus*, *Chloropeltis*, *Tracholomonas*, *Rhaphidomonas*, *Calanomonas*, *Acetabularia*, and *Cochlorella*. Nearly all occur in fresh water, especially when stagnant, though a few are found in brackish water. They may be single or in small groups, or may form very extensive colonies.

(b) Later, the name of the portion of the eucharist sent to the sick, or by bishops to other bishops and churches as a token of Christian love. These practices were early discontinued, because of the growing reverence for the elements. (c) Later still, the name given to the unconsecrated bread not needed in the eucharist, but blessed and distributed as a substitute for the eucharist among those members of the congregation who, though they had the right to take the communion, did not commune. This custom still exists in the Greek Church. Also called *antidoron* (which see). Also *eulogy*.

As soon as Mass had been ended, a loaf of bread was blessed, and then, with a knife very likely set apart for the purpose, cut into small slices, for distribution among the people, who went up and received it from the priest, whose hand they kissed. N. and Q., 7th ser., VI, 11.

= Syn. 1. *Eucronium, Eulogy, Eulodion, Panegyric.* These words are best understood through their history. (See the derivations.) *Eulogy* is stronger than *eucronium*, but still is the most general word. An *eucronium* is an expression of warm praise, of some fullness and completeness, like the ancient laudatory ode; *eucronium* is not a distinctive name for a set speech; the others may be; as, Livy's *Eulogy* upon the Filizini Fathers; the *Panegyric* of Isocrates. *Eulodion* is only a more formal word for *eulogy*. The last three may be used abstractly, but not *eucronium*; we may say, it was mere *eulogy* or *panegyric*, but not mere *eucronium*. *Eulogy, a eulogy*, and an *eucronium* may be tempered with criticism; *panegyric* and a *panegyric* are only praise; hence, *panegyric* is often used for exaggerated or undiscriminating praise.

Plutarch assures us that our author [Cicero] . . . made a speech in public full of the highest eucroniums on Cæsar.

Melmoth, tr. of Cicero, i, 5, note 3.

Men with tears coursing down their cheeks in listening to his [Choate's] sonorous periods in his eulogy upon Webster yet slyly made a memorandum that they would count the words in some of those periods when they should be printed.

Collectors of coins, dresses, and butterflies have astonished the world with eulogiums which would raise their particular studies into the first ranks of philosophy.

Eupetes macrourus.

the grallatorial genus *Mesites* has been placed, there being some superficial resemblance between these two genera. It appears to be nearest the *Crotopodidae*, or true babbling thrushes. The bill is long, the neck extremely slender, and covered like the head with short, velvety feathers. The type species, *E. macrourus*, inhabits the Malay peninsula and Sumatra; *E. carubensis* is found in New Guinea.

Dana, 1850.

Euphausia leaves the egg as a true nauplius with its three pairs of appendages, a mouth being present though the alimentary canal is not open at the posterior end. With succeeding months new appendages are formed and the carapace outlined, while the abdomen does not make its appearance, except in a very rudimentary condition, until six appendages are outlined. A modified food condition now ensues, from which the adult is gradually produced by a series of moults. Staud., Nat. Hist., II, 11.

Euphausiidae (û-fa-û'si-â-dê), *n. pl.* [NL., < *Euphausia* + *-idae*.] A family of opossum-shrimps, taking name from the genus *Euphausia*. In *rhet.*, the use of a mild, delicate, or indirect word or expression in place of a plainer and more accurate one, which by reason of its meaning or its associations or suggestions might be offensive, unpleasant, or embarrassing.

This instinct of politeness in speech — *euphemism*, as it is called — which seeks to hint at an unpleasant or an indelicate thing rather than name it directly, has had much to do in making words acquire new meanings and lose old ones; thus 'plain' has usurped the sense of 'ugly'; 'fast' of 'dissipated'; 'gallantry' of 'licentiousness.'

Chambers, Int. for the People.

2. A word or expression thus substituted; as, to employ a *euphemism*.

When it was said of the martyr St. Stephen that "he fell asleep," instead of "he died," the *euphemism* partakes of the nature of a metaphor, intimating a resemblance between sleep and the death of such a person.

Eupoberiidae (û-fê-hê-ri-â-dê), *n. pl.* [NL., < *Eupoberia* + *-idae*.] An extinct family of myriapods, of the order *Archipolypoda*. They had the anterior and posterior parts differentiated, the dorsal plates more or less consolidated, and several longitudinal rows of spines or protuberances along the back. The species lived during the Carboniferous epoch.

The discourse of Sir Pierre Shafton, in "The Monastery," is rather a caricature than a fair sample of *euphuism*. . . . Perhaps, indeed, our language is, after all, indebted to this writer [Lyly] and his *euphuism* for not a little of its present euphony. *Craik*, Hist. Eng. Lang., I. 495.

So far, then, there is in the father of *euphuism* [Lyly] nothing but an exaggerated development of tastes and tendencies which he shared not only with a generation of writers, but with the literary currents of a century, indeed of more centuries than one.

A. W. Ward, Eng. Dram. Lit., I. 156.

Craik, Hist. Eng. Lang., I. 473.

The *euphuistic* style was an exaggeration of the "Italianating" taste which had begun with the revival of our poetical literature in the days of Henry VIII., but to which Lyly was the first to give full expression in prose.

A. W. Ward, Eng. Dram. Lit., I. 157.

Alloys are regarded as eutectic compounds, and the same principles apply to the mixtures of fused silicates of which volcanic glass, slags, etc., are formed.

Metallic alloys are true homologues of the cryohydrates; the ratios in which metals unite to form the alloy possessing the lowest melting-point are never atomic ratios, and when metals do unite in atomic ratios the alloy produced is never eutectic, i. e. having a minimum solidifying point. Thus pure cast-iron is not a carbide of iron, but an eutectic alloy of carbon and iron. Similar hyperchemical mass ratios are found to exist among anhydrous salts; when one

salt fused per se acts as a solvent to another salt, forming eutectic salt alloys, similar to eutectic metallic alloys and the cryohydrates. *E. Guthrie, Nature*, XXXIII, 21.

3. In *fencing*, the avoiding of a thrust by moving the body without changing the position of the feet. *Rolando* (ed. Forsyth). = *Syn. Evasion*, *Equivocation*, *Prevarication*, *Shift*, *Subterfuge*, quibble, all express artful or dishonorable modes of escaping from being frustrated or found out. The first three imply the use of language; *shift* and *subterfuge* may be by words or actions. *Evasion* in speech may be simply avoiding, as by turning the conversation or meeting one question with another. *Equivocation* is using words in double and deceptive senses. *Prevarication* may be in action, but is properly understood to be in words; it includes all tricks of language that fall short of downright falsehood; it is, literally, a stepping on both sides of the truth; the word is a strong one. All these words convey opprobrium in proportion to the amount of insincerity implied. *Shift* and *subterfuge* may be modes of *evasion*; *shift*, a thing turned to as a mean expedient, a trick; *subterfuge*, a place of hiding, hence an artifice. *Shift* does not necessarily express a dishonorable course, and *evasion* and *subterfuge* are often lightly used. 2. In *astron.*: (a) The second lunar inequality, described by Ptolemy. It comes to its maximum value at the quadratures, and disappears at the conjunctions and oppositions. Ptolemy accounted for it by supposing that the apogee of the moon's orbit or deferent of its epicycle recedes to the west at a uniform angular rate of 11 2 per diem, while the center of the epicycle advances to the east at a uniform angular rate of motion about the earth of 13 11, the mean sun always bisecting the arc of the zodiac between the lunar apogee and the center of the lunar epicycle. This theory represented the longitudes with remarkable accuracy, but was utterly inconsistent with the most obvious observations respecting the moon's apparent diameter. According to modern astronomy, the evecton is a perturbation of the moon by the sun, due to the fact that the sun tends to separate the moon and the earth by attracting more the nearer body. It thus exaggerates the effect of the eccentricity of the moon's orbit when the transverse axis of the latter lies near the line of syzygies. (b) The moon's libration. - **Evecton of heat**, the diffusion of heated particles through a fluid in the process of heating it; convection.

Tennyson, In Memoriam, Conclusion.

3. In public games and sports, each contest or single proceeding in a program or series: as, the *events* of the day were a bicycle-race, a foot-race, high jumps, etc.; the steeplechase was a spirited *event*.—4. A contingent, probable, or possible happening; a coming to pass; in the theory of probabilities, anything which may or may not be; any general state of things considered as having a probability: as, in the *event* of his death his interest will lapse.—Compound

event, that which in reference to its probability is regarded as consisting in the concatenation or coincidence of two or more different events.—Double *event*, two races, or other trials of strength or skill, upon the winning of both of which depends the winning of a certain wager or stake.—Simple *event*, in the doctrine of probabilities, something whose probability is deduced from direct observation.—Syn. 1. *Event, Occurrence, Incident, Circumstance, affair.* An *event* is of more importance than an *occurrence*; the word is generally applied to the larger transactions in history. *Occurrence* is literally that which meets us in our progress through life, and does not connect itself with the past as an *event* does. An *incident* is that which falls into a state of things to which it does not primarily belong; as, the *incidents* of a journey. It is applied to matters of minor importance. *Circumstance* does not necessarily mean anything that happens or takes place, but may simply mean one of the surrounding or accompanying conditions of an occurrence, incident, or event; it is also applied to incidents of minor moment which take place along with something of more importance. A person giving an account of a campaign might dwell on the leading *events* which it produced, might mention some of its striking *occurrences*, might refer to some remarkable *incidents* which attended it, and might give details of the favorable or adverse *circumstances* by which it was accompanied. See *exigency*.

The group embraces the cyprinids, catostomids, and lobitids. It is rated by some authors as an order equivalent to *Pleurospindyl*, by others as a suborder of plectrospindylous fishes.

generalizing adverb; *æle*, *each*: see *ever* and

sidered indefinitely as a unitary part of an ag-
gregate; all of a collective or aggregate num-
ber, taken one by one; any, as representing
all of whom or of which the same thing is pred-
icated. A proposition containing *every* before a class
name is equivalent to the totality of statements formed
by replacing this expression by the name of each in-
dividual of the class. But if *not* is placed before *every*,
the meaning is that some one or more of these individual
propositions are not true. Thus, "not every man is a
poet" does not mean that not any man is a poet, but only
that some men are not poets. In many cases, however,
every is ambiguous.

Whenever a true theory appears, it will be its own *evidence*. *Emerson, Nature*, p. 7. *Evidence* signifies that which demonstrates, makes clear, or ascertains the truth of the very fact or point in issue, either on the one side or on the other. *Blackstone, Com.*, III. xxiii. (c) Information, whether consisting of the testimony of witnesses or the contents of documents, or derived from inspection of objects, which tends, or is presented as tending, to make clear the fact in question in a legal investigation or trial; testimony; as, he offered *evidence* of good character. His *evidence*, if he were called by law To swear to some enormity he saw, For want of prominence and just relief Would hang an honest man and save a thief. *Cowper, Conversation*. The *evidence* of a deeply interested witness, given on the side which his interest would incline him to give it, is of no value when the circumstances are such that he cannot be contradicted on the subject-matter of his *evidence*. *Nineteenth Century*, XX. 456. (d) In a more restricted sense, that part of such information or testimony which is properly receivable or has actually been received by the court on the trial of an issue; sometimes more specifically characterized as *judicial evidence*; as, that is not *evidence*, my lord; the age of the accused is not *evidence*. In this latter sense sometimes, especially in equity practice, spoken of as the *proofs*. (e) The rules by which the reception of testimony is regulated in courts of justice; as, a treatise on *evidence*; professor of pleading and *evidence*.—**Administrative, circumstantial, conclusive, cumulative, extrinsic, hearsay, etc., evidence.** See the adjectives.—**Demurrer to evidence.** See *demurrer*.—**Direct evidence**, that which goes expressly to the very point in question; that which, if believed, proves the point without aid from inference or reasoning, as the testimony of an eye witness to an occurrence, as distinguished from *indirect* or *circumstantial evidence, which goes expressly to other facts only, from which it is proposed to infer what was the fact on the point in question.—**Documentary evidence**, evidence supplied by written instruments.—**Documentary Evidence Act**, an English statute of 1868 (31 and 32 Vict., c. 37), making all laws, proclamations, and other official documents which purport to be printed in the *Gazette* or by the government printer, or certified by the clerk of the Privy Council, and also, by an amendment in 1882 (45 Vict., c. 9), if they purport to be printed by authority of Her Majesty's Stationery Office, receivable in evidence without further proof.—**Evidence alimide.** See *alimide*.—**Evidences of Christianity.** See *Christianity*.—**Formal evidence**, the character of the act of reason by which anything is recognized as certain and indubitable. **Immediate evidence**, that state or degree of evidentialness which belongs to an object plainly perceived. In *evidence*, (a) *In loco*, having been received by the court as competent evidence in the cause on trial; being a part of the accepted proofs. (b) Plainly visible; conspicuous; a recent phrase adopted from the French *en evidence*.—**Instruments of evidence**, the media, such as witnesses, documents, etc., through which the evidence of facts is conveyed to the mind of a judicial tribunal. *Best.*—**King's evidence, queen's evidence, state's evidence**, one charged with a crime who waives his privilege against incriminating himself in order that his testimony as a witness may be used to convict another implicated with him. **Law of evidence**, that part of the law which determines the necessity, the methods, and the sufficiency of proof of facts as a basis for the administration of justice. It is a system consisting partly of principles and partly of artificial rules, established partly by precedent and partly by statute, and originating partly in logical principles and partly in judicial experience in investigating controversies by means of human testimony; the object of the system being to guide courts in deciding what subjects require proof, what facts are to be received as evidence, what testimony or documents may be used for the purpose and in what manner, and what the effect of evidence thus received should be. **Mediate evidence**, the clearness and force of a demonstration. **Moral evidence**, the evidence of an irresistible probable argument. **Negative evidence.** See *positive evidence*. **Objective evidence**, the character of the object of a certain and indubitable cognition. **Opinion evidence.** See *opinion*. **Oral evidence, parole evidence**, evidence by word of mouth; testimony, as distinguished from documentary evidence. Testimony taken by deposition, and thus presented in writing, is deemed oral evidence, not documentary evidence. **Positive evidence**, (a) Direct evidence (which see above). (b) Testimony to having witnessed an act or event, as distinguished from *negative evidence*, or the testimony of a witness who was present and observant, that such act or event did not take place. As between equally credible witnesses, positive testimony is entitled to more weight than negative, because it may be that one witness, though present, did not see or hear that which another witness did. **Presumptive evidence, prima facie evidence**, evidence sufficient if not controverted; used technically in two distinct senses which are often confused.—(a) Evidence sufficient to go to the jury, and on*

which therefore it would be error for the judge to decide in place of the jury, but on which the jury may fairly decide either way. (b) Evidence sufficient not only to go to the jury, but to require them to find accordingly if no credible contrary evidence be given.—**Primary evidence**, the best evidence, as distinguished from *secondary evidence*; or evidence of such a nature as to imply (unless explanation is given) that better evidence exists and is kept back. Thus, if it is sought to prove the contents of a written contract, the instrument itself is the best evidence of the contents, and it must be produced, or satisfactory excuse must be given, before witnesses can be allowed to testify what the contents were. But among such witnesses the testimony of the writer of it, though more satisfactory than that of others, is not therefore deemed the best or primary evidence in the technical sense.—**Real evidence**, the evidence afforded by inspection or actual examination of the person or thing by the court or jury, when the question involves the condition of such person or thing.—**Satisfactory evidence, or sufficient evidence**, such evidence as in amount is adequate to justify the court or jury in adopting the conclusion in support of which it is adduced.—**Secondary evidence**, evidence not primary, but which may be admitted upon showing proper reasons for failure to obtain primary evidence.—**Syn.** *Testimony, Evidence, Proof, Exhibit, deposition, affidavit*. In law, *testimony* is evidence given by witnesses. *Evidence* is the broader term, including that which is given by witnesses or afforded by documents or by the inspection of the person or object itself. *Proof* is the effect of evidence in establishing the conclusion of fact to support which it is adduced. *Proofs* are the evidence in a cause, including testimony and documents. An *exhibit* is a document which has been presented as evidence. **evidence** (ēv'i-dens), *v. t.*; pret. and pp. *evidenced*, pp. *evidencing*. [*Evidence*, *n.*] 1. To make evident or clear; show clearly; prove. These things the Christian religion requires, as might be *evidenced* from texts. *Tillotson*. Hence—2. The process of evolving or becoming developed; an unfolding or growth from, or as if from, a germ or latent state, or from a plan; development; as, the *evolution* of history or of a dramatic plot.

The whole *evolution* of ages, from everlasting to everlasting, is so collected and presentifically represented to God at once, as if all things which ever were, are, or shall be, were at this very instant really present.

The *evolution* of the sickening vapours emitted by foul oxide need not be a source of annoyance, as the oxide can be revived in the purifiers.

W. R. Bowditch, Coal Gas, xi, 21.

Specifically—(a) In *biol.*: (1) The actual formation of a part or of the whole of an organism which previously existed only as a germ or rudiment; ordinary natural growth, as of living creatures, from the germinal or embryonic to the adult or perfect state; as, the *evolution* of an animal from the ovum, or of a plant from the seed; the *evolution* of the blossom from the bud, or of the fruit from the flower; the *evolution* of the butterfly from the caterpillar; the *evolution* of the brain from primitive cerebral vesicles, or of the lungs from an outshoot of the intestine. (2) The release, emergence, or exclusion of an animal or a plant, or of some stage or part thereof, from any covering which contained it; as, the *evolution* of spores from an encysted animalcule; the *evolution* of a moth from the cocoon, of an insect from the wood or mud in which it lived as a larva, of a chick from the egg-shell which contained it as an embryo.

The parasite is often taken for the Hessian fly. . . . Many have been deceived by the specious circumstance of its *evolution* from the pupa of the destroying insect. *Say*.

(b) Descent or derivation, as of offspring from parents; the actual result of generation or procreation. As a fact, this *evolution* is not open to question. As a doctrine or theory of generation, it is susceptible of different interpretations. In one view, the germ actually preexists in one or the other parent and is simply unfolded or expanded, but not actually formed in the act of procreation. (See *evolution, spiritual*.) This view is now generally abandoned, the current opinion being that each parent furnishes materials for the substance of the germ, whose *evolution* results from the union of such elements. See *epigenesis*. (1) The fact or the doctrine of the derivation or descent,

with modification, of all existing species, genera, orders, classes, etc., of animals and plants, from a few simple forms of life, if not from one; the doctrine of derivation; evolutionism. (See *Darwinism*.) In this sense, *evolution* is opposed to *creationism*, or the view that all living things have been created at some time substantially as they now exist. Modern evolutionary theories, however, are less concerned with the problem of the origination of life than with questions of the ways and means by which living organisms have assumed their actual characters or forms. Phylogenetic evolution insists upon the direct derivation of all forms of life from other antecedent forms, in no other way than as, in ontogeny, offspring are derived from parents, and consequently grades all actual affinities according to propinquity or remoteness of genetic succession. It presumes that, as a rule, such derivation or descent, with modification, is from the more simple to the more complex forms, from low to high in organization, and from the more generalized to the more specialized in structure and function; but it also recognizes retrograde development, degeneration or degradation. The doctrine is now accepted by most biologists as a conception which most nearly coincides with the ascertained facts in the case, and which best explains observed facts, though it is held with many shades of individual opinion in this or that particular. See *natural selection*, under *selection*.

Evolution, or development, is, in fact, at present employed in biology as a general name for the history of the steps by which any living being has acquired the morphological and the physiological characters which distinguish it. *Huxley, Evolution in Biology*.

(b) In general, the passage from unorganized simplicity to organized complexity (that is, to a nicer and more elaborate arrangement for reaching definite ends), this process being regarded as of the nature of a growth. Thus, the development of planetary bodies from nebular or gaseous matter, and the history of the development of an individual plant or animal, or of society, are examples of evolution.

Evolution is an integration of matter and concomitant dissipation of motion; during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity; and during which the retained motion undergoes a parallel transformation.

H. Spencer, First Principles, § 145.

The hypothesis of *evolution* supposes that in all this vast progression there would be no breach of continuity, no point at which we could say, "This is a natural process," and, "This is not a natural process"; but that the whole might be compared to that wonderful process of development which may be seen going on every day under our eyes, in virtue of which there arises, out of the semi-fluid, comparatively homogeneous substance which we call an egg, the complicated organization of one of the higher animals. That, in a few words, is what is meant by the hypothesis of *evolution*. *Huxley, Amer. Addresses*, p. 10.

(c) Continuous succession; serial development. 3. In math.: (a) In *geom.*, the unfolding or opening of a curve, and making it describe an evolution. The equable evolution of the periphery of a circle or other curve is such a gradual approach of the circumference to straightness that its parts do not concave and equally evolve or unbind, so that the same line becomes successively a smaller arc of a reciprocally greater circle, till at last they change into a straight line. (b) The extraction of roots from powers: the reverse of *involution* (which see).—4. A turning or shifting movement; a passing back and forth; change and interchange of position, especially for the working out of a purpose or a plan; specifically, the movement of troops or ships of war in wheeling, countermarching, maneuvering, etc., for disposition in order of battle or in line on parade; generally in the plural, to express the whole series of movements.

These *evolutions* are doublings of ranks or files, countermarches, and wheelings. *Harris*.

of time, after, from, since; of cause, from,
through, by reason of, etc.; in comp., out,
forth, out of, throughout, to the end, hence thor-
oughly, utterly, etc. (equiv. to *out* or *up* used
intensively); in L.L. *ex* is also used, as now in
E., to signify 'out of office': *exconsularis*, an ex-
consul, etc. As a prefix *ex* stands before
vowels and *h* and before *e*, *p*, *q*, *t*, and before
s, the *s* being in this case optionally dropped;
e. g., *existere* ('*ex*-*sistere*') or *existere*, exist, one
s, orthographically the second, phonetically the
first (*existere* being pronounced *ex-sistere*), be-
ing omitted; before *f* *ex* becomes *ef*, some-

most cases of this kind the L. form *ex* has been
restored. See further under *ex*.] A prefix
of Latin, and in some cases of Greek origin, mean-
ing primarily 'out,' 'out of.' In English words
it preserves or reproduces its particular uses in the
language of its origin. (See etymology.) Thus, in *ex-clude*,
ex-clude, etc., it signifies 'out,' 'out of'; in *ex-clude*, 'out';
in *ex-ceed*, *ex-ceed*, etc., 'beyond.' It is often (especially in
the reduced form *e*) simply privative, as in *ex-stipulate*,
ex-clude. In some words it is intensive merely, in others
it has no particular force. Prefixes to names implying
office, *ex* signifies that the person has held but is now 'out
of' that office; as, *ex-president*, *ex-minister*, *ex-senator*.

=Syn. 1. *Examination*, *Inquiry*, *Investigation*, *Inquisition*, *Scrutiny*, *Search*, *Research*, *Inspection*; overhauling, probing, canvassing. *Examination* is the general word; where it is applied to any work of severity, thoroughness, etc., the fact is expressed by a strong adjective or other modifier; as, a superficial, thorough, brief, protracted, or searching *examination* into facts, into a question, of a candidate, or of a locality or premises. *Inquiry* is made by asking questions, but figuratively by study or *investigation*; as, an *inquiry* into the value of circumstantial evidence. An *investigation* is an examination long enough, systematic enough, and minute enough to be thorough. An *inquisition* is something still more thorough and searching than an *investigation*, implying vigor with severity; in modern times it generally implies a somewhat hostile spirit, or that from which the person concerned would shrink. *Scrutiny* is primarily a close examination with the eye; as, the *scrutiny* of one's features, of a manuscript, of a field of vision; but it is also a critical examination by the mind; as, the careful *scrutiny* of evidence. *Search* is the effort to find primarily that which may be seen, but secondarily that which may be apprehended by the mind; as, the *search* for a lost coin, or for a clue to a mystery. *Research* is *search* only of the second class above, and in out-of-the-way fields of knowledge; as, archaeological *research*. *Inspection*, literally a looking into, is sometimes a rather general word and equivalent to *examination*; but more often it implies an official *examination*; as, an *inspection* of work done under contract; the sanitary *inspection* of a jail, or of a ship just come into port.

2. An instance serving for illustration; a particular case or circumstance, quotation, or other thing, illustrating a general statement, proposition, rule, or truth. [Though etymologically the same as *sample*, an *example*, in this use of the word, is not, like a *sample*, commonly taken at random, but chosen with care for the purpose of aiding the mind of a reader or hearer in comprehending an abstract proposition or description. An *example* is, in fact, but a single instance, either given alone or with a small number of others, and in such a manner that the reader or person addressed has no means of judging as to how it has been chosen; it therefore affords little or no ground for inductive reasoning. See *sample*.]

An audience rushing out of a theatre on fire, and in their eagerness to get before each other jamming up the doorway so that no one can get through, offers a good *example* of unjust selfishness defeating itself.

Sir T. Wilson, Rule of Reason.

= **Syn.** *Example*, *Pattern*, *Model*, *Precedent*, *Ideal*, *Instance*; archetype, prototype, exemplification. *Example* is the most general of these words; it is the only one of them that admits application to that which is to be avoided. An *example* is something to guide the understanding, so that one may decide what to do and what not to do. *Pattern* and *model* express that which is to be closely followed or copied; they primarily refer to physical shape; as, an artist's *model*; but also to the shaping of conduct and character; as, a *pattern* of sobriety, a *model* of virtue. Perhaps *model* suggests the more complete *example*, but the difference between the two words in this respect is small. A *precedent* is an *example* set in the past as a legal decision which may be pleaded in law as the basis of a further decision, and in private affairs a thing once done or allowed, and so pleaded as a reason or an excuse for more of the same sort, as, a *precedent* for indulgence. An *ideal* is a model of perfection, primarily imaginary, but by hyperbole sometimes real. An *example* is generally a representative person or thing, but the word is sometimes used instead of *instance*, with reference to a representative act or course of conduct, as, to prove a rule by *examples*; to prove a man's fidelity or treachery by *instances* or *examples*.

(d) In common-law practice, the specific statement, required to be in writing or noted on the record, of an objection taken by a party to a ruling or decision by the court or a referee, the object being to show to the higher court to which the matter may be appealed that the ruling was adhered to and carried into effect against explicit objection, or to inform the adverse party of the precise point of the objection, or both. See *bill of exceptions*, below.

In the Roman law *exceptio* was a plea similar to our confession and avoidance. Thus, such a plea would be a claim to offset a debt. In a narrower sense, however, it was restricted to the plea that an action competent in law should be excluded on the ground of equity. Such a plea was held to be dangerous, because, the facts alleged by way of exception being once disproved, the claim of the plaintiff was held to be proved as good in law by the pleading of the *exceptio*. Hence, probably, the maxim "The *exceptio* proves the rule" (Latin *exceptio probat regulam*, 11 Coke 41; French *l'exception prouve la règle*), which is certainly of legal origin. The words "in cases not excepted" (Latin *in casibus non exceptis*), however, commonly added, and the maxim is taken to mean that an express exception implies that the general rule is the opposite of the case mentioned.

Ascription corroborates the application of law in cases not excepted, so enumeration invalidates it in cases not enumerated.

Bacon, De Augustis (ed. Spedding), VIII. iii.
If it be well weighed, that certificate makes against them; for as *exceptio fiend boni in casibus non exceptis*, so the excepting of that shire by itself doth fortify that the rest of the shires were included in the very point of difference. *Bacon*, Jurisdiction of the Marches.

Exchange, interchange, interchange.** *Exchange* may bring only one actor into prominence, or two may be equally prominent; if more than two take part in an *exchange*, the mind rests upon the act as performed by pairs. [cap.] In England, an ancient court or tribunal, more fully designated the *Court of Exchequer*, in which all causes affecting the revenues of the crown were tried and decided. In course of time it acquired the jurisdiction of ordinary superior common law courts, by allowing any suitor who desired to bring his complaint before it to allege that by the defendant's injustice he was prevented from discharging his debts to the king's revenues, which allegation the court did not allow to be denied. The court also had, up to 1841, an equity side. The judges were called barons. In 1875 the court was made the Exchequer Division of the new High Court of Justice.

The *Exchequer* of the Norman kings was the court in which the whole financial business of the country was transacted; and as the whole administration of justice, and even the military organisation, was dependent upon the fiscal officers, the whole framework of society may be said to have passed annually under its review. It derived its name from the checkered cloth which covered the table at which the accounts were taken, a name which suggested to the spectator the idea of a game at chess between the receiver and the payer, the treasurer and the sheriff. As this name never occurs before the reign of Henry I., and as the tradition of the court preserved the remembrance of a time when the business which took place in it was transacted 'ad tales,' 'at the tallies,' it seems certain that the date of complete organisation should be referred to this period.

Stubbs, Const. Hist., s. 126.

It was supplanted by the Court of Appeal in 1875. **Exchequer bill,** a negotiable interest-bearing bill of credit, issued under the authority of acts of Parliament, by the Exchequer Department of the British government, for the purpose of raising money for temporary purposes, or to meet some sudden emergency. Exchequer bills run for five years; the interest is payable per attached coupons half-yearly, and is fixed every year, but can never exceed 5 per cent. per annum. They are issued for sums of £100 each, or some multiple of £100. They were first issued in 1696, and form a large part of the unfunded public debt of Great Britain. **Exchequer bonds,** bonds issued in Great Britain by the commissioners of the Treasury, under authority of the same act as *exchequer bills*, and for the same purpose, which run for a definite period of time, not exceeding six years, the interest payable on the same, which can never exceed 5 per cent. per annum, being fixed at the time of issue.

Excommunication, often with very severe consequences, was practised in various ways among the ancient Greeks, Romans, and Jews, and is still in use among the Mohammedans. In the early Christian church it consisted simply in the exclusion of an offending member from fellowship by some formal action, and this is the practice in most modern Protestant churches. As the power of the church increased, excommunication became more complicated in method and severe in effect. As now practised in the Roman Catholic and related churches, it may be either partial or total, temporary or perpetual. By the partial, called the *minor* or *lesser excommunication*, the offender is suspended from the use of the sacraments, and perhaps from the privileges of church worship; by the total, or the *major* or *greater excommunication*, he is also cut off from the society and fellowship of the church, and it may be from all intercourse with its members. Further distinctions as to the sentence and its effects are made in the Roman Catholic Church. See *anathema*, *disipline*.

Latimer, 2d Sermon before Edw. VI., 1559.

The act of *excommunication* . . . neither shuts out from the mystical, nor clean from the visible, but only from fellowship with the visible in holy duties.

Hooker, Eccles. Polity, iii. 1.

Excommunication seems but a light thing when there are many communions. It was no light thing when it was equivalent to outlawry; when the person excommunicated might be seized and imprisoned at the will of the ordinary; when he was cut off from all holy offices; when no one might speak to him, trade with him, or show him the most trivial courtesy; and when his friends, if they dared to assist him, were subject to the same penalties.

Convention does not allow us to say "It executes," as we say "It blows" or "It thunders," because (if for no other reason) the group of phenomena is not one of familiar immemorial occurrence. But we can just as conveniently adopt the *existential* form, "There was an execution," as the predicative form, "A man was hanged"; and as a matter of fact, one form would be as readily employed as the other.

In abdominal and thoracic somites it may be very small, or entirely suppressed, especially when the *endopodite* is highly developed as an ambulatory leg. (See cut under *endopodite*.) In maxillary segments it forms a variously modified appendage of those parts (see cut under *Cyclops*), in an antennary segment it may be a mere scale at the base of the very long and many jointed *endopodite* (antenna or feeler).

H. James, Jr., Pass. Pilgrim, p. 230.

2. The state of being expanded; enlargement; distention; dilatation; increase of extent, size, bulk, amount, etc. In the case of the expansion of solids by heat, account is taken of the increase in length or linear expansion, in surface (superficial expansion), and in volume (cubical expansion). The increment in length of the unit for a change of 1 in temperature, or the rate of increase of the unit with the temperature, is called the coefficient of linear expansion; and the coefficients of superficial and cubical expansion, which are respectively two and three times the linear coefficient, are similarly defined. In the case of liquids and gases the expansion in volume is alone considered. The real or absolute expansion of a liquid is the actual increase in volume, while the apparent expansion is that which is observed when a liquid contained in a vessel is heated, and which is less than the real expansion, because of the simultaneous expansion of the vessel itself. It is found that the coefficient of expansion is nearly the same for different gases, and sensibly so for the so-called permanent gases, as hydrogen, oxygen, etc. This coefficient is equal to .003667 for 1° C., or about $\frac{1}{273}$; that is, at 273° C. the volume of a gas expanding under constant pressure is double its volume at 0°; and at -273° C. the volume would be theoretically zero. This last temperature is called the absolute zero.

Spread not into boundless *expansions* either of designs or desires.

Diffuses beauty, in unbounded store,
Through seas and fertile plains, and all that lies
Beneath the starry'd *expansion* of the skies.

Beattie, Lucretius, i.

Distance or space, in its simple abstract conception, to avoid confusion, I call *expansion*, to distinguish it from extension, which by some is used to express this distance only as it is in the solid parts of matter, and so includes or at least intimates the idea of body. . . . I prefer also the word *expansion* to space, because space is often applied to distance of fleeting successive parts, as well as to those which are permanent.

Locke, Human Understanding, II. xv. 1.

expansion-engine (eks-pan'shon-en-jin), *n.* A steam-engine in which the supply of steam is cut off previous to the completion of the stroke, the expansive power of the steam admitted being sufficient to complete the stroke.—*Triple expansion-engine*, a steam-engine in which steam is expanded in three cylinders in succession, the exhaust from the first driving the piston of the second, and so on.

expansion-gear (eks-pan'shon-gēr), *n.* In a steam-engine, all those parts of the mechanism that control the admission of the live steam from the boiler to the main valve-system and thus to the cylinder. The expansion gear is intermediate between the actual controlling system of mechanism, which makes the engine automatic, and the steam,

controlling the automatic system by independent eccentric systems that may be automatic or may be controlled by the governor or by appliances practically outside the engine. The effect of this supplementary system is to cut off the supply of steam to the slide valves at any required point of the stroke, for the purpose of using the expansion of the steam already admitted to finish the stroke. This cut-off of the steam may be variable where the expansion admits of it, changing the point of cut-off at will while the engine is at work; it may be fixed or secured at some predetermined point of the stroke; or it may be automatic or self-varying. The most common apparatus includes an expansion-valve moving on the slide valve and controlled by an eccentric cam on the shaft or by the governor. See *cut-off* and *link-motion*.

expansion-joint (eks-pan'shon-joint), *n.* In *steam-engin.*; (a) Any kind of joint for connecting steam-pipes which permits the pipe to expand or contract under varying temperatures without increase of its length over all. (b) An attachment of a boiler in its framing to allow the former to expand without affecting the latter.

expansion-valve (eks-pan'shon-valv), *n.* In a steam-engine, a valve which shuts off the steam in its passage to the slide-valves when the piston has traveled a certain distance in the cylinder, leaving the remaining part of the stroke to be performed by the expansion of the steam. See *expansion-gear*.

Ex-parte hearings, evidence, etc., are often resorted to for temporary relief, or for convenience and expedition, and are not supposed to affect the substantial rights of the absent party. Councils are of two kinds—mutual and ex-parte. A mutual council is one in the calling of which all parties to the difficulty or perplexity concerning which relief is sought unite. An *ex-parte council* is one which is called by one of those parties, after every proper effort to induce all interested to call a mutual council has failed.

Bibliotheca Sacra, XLII, 539.

The ill repute which attaches to considerations of *expediency*, so far as it is well founded, is chiefly due to the fact that, when the question of conduct at issue is one which the person debating it has a private interest in deciding one way or the other—when he himself will gain pleasure or avoid pain by either decision—the admission of *expediency* as the ground of decision is apt to give him an excuse for deciding in his own favour.

F. H. Green, Prolegomena to Ethics, § 330.

He proposed a most excellent *expediency* (which would be of happy use if still continued), for the satisfaction of some scrupulous members in the House of Commons, about the ceremonies of our Church.

Macaulay, Macaulay.

If protestants commit suicide more often than catholics, we explain this fact by showing that suicide is increased by civilization, and that in the main catholics are more ignorant and uncivilized. *P. H. Booden, Logic, III, ii, 2.*

To explain away, to deprive of significance by explanation; nullify or get rid of the apparent import of; clear away by interpretation; generally with an adverse implication: as, to explain away a passage of Scripture; to explain away one's fault or offense.

Those explain the meaning quite awry. *Pope, Essay on Criticism, I, 117.*

Conscience is no longer recognized as an independent arbiter of actions; its authority is explained away. *J. H. Newman, Parochial Sermons, I, 332.*

—**Syn.** *Exploit, Expound, Interpret, Elucidate*. *Exploit* is the most general of these words, and means to make plain, clear, and intelligible. *Expound* is used of elaborate, formal, or methodical explanation: as, to expound a text, the law, the philosophy of Aristotle. *Interpret* is to explain, as if from a foreign language, to make clear what before was dark, and generally by following the original closely, as by word and line by line, as, to interpret Hegel, Swedenborg, Emerson. *To elucidate* is to bring or work out into the light that which before was dark, usually by means of illustration; the word generally implies, like *expound*, a somewhat protracted or elaborate process. See *translate*.

The quarrel is a very pretty quarrel as it stands; we should only spoil it by trying to explain it. *Sheridan, The Rivals, iv, 3.*

The aim in *expounding* a great poem should be not to discover an endless variety of meanings often contradictory, but what ever it has of great and personal significance. *Lowell, Among my Books, 2d ser., p. 44.*

One speaks the glory of the British Queen,
And one describes a charming Indian scene;
A third interprets motions, looks, and eyes. *Pope, R. of the L., iii, 2.*

The scheme of the Gospel is not only of the most transcendent use, as it continues, elucidates, and enforces the moral law, but of the most absolute necessity.

Rp. Harp, Works, VI, iv.

II. intrans. To give explanations.

I shall not extenuate, but explain and dilucidate, according to the custom of the ancients. *Sic T. Browne, Vulg. Err.*

explainer (eks-plā-nēr), *n.* One who explains; an expositor; an interpreter.

Unless he can show his authority to be the sole explainer of fundamentals, he will in vain make such a pooder about his fundamentals. Another explainer, of as good authority as he, will set up others against them. *Locke, Mind of Christianity.*

(a) The act or process of making plain or clear the nature, meaning, or significance of something; the act of rendering intelligible what was before obscure, as by analysis or explication; elucidation; interpretation: as, the explanation of a passage in Scripture, or of a contract or treaty.

Explanation, then is analysis, not a mere setting forth or extraneousable. It takes the object, or the thing to be explained, and is a perfect analysis which the process of explanation obtained can be put together again, and so the whole. *G. H. Lewis, Prob. of Lit. and Mus., II, 104.*

(b) The process of showing facts or a general proposition the causal or logical antecedents or conditions of the thing or event which is to be explained, and so explaining, the making clear by reasoning how certain observed or admitted facts may have been brought about by the action of known principles, if a certain supposition is allowed, the modification of a confused mass of facts by means of a single known or supposed fact from which they would all necessarily or probably result.

The word *explication* occurs so continually and holds so important a place in philosophy, that a little time spent in fixing the meaning of it will be richly repaid. An individual fact is said to be explained by pointing out its cause, that is, by stating the law or laws of causation of which its production is an instance. Thus, a conflagration is explained when it is proved to have arisen from a spark falling into the midst of a heap of combustibles. *J. S. Mill, Logic, III, vi, § 1.*

3. *In alg.*, a symbol placed above and at the right of another symbol (the base), to denote that the latter is to be raised to the power indicated by the former. Thus, $a^2 = aa$, 2 being the exponent. The process symbolized by a negative exponent is the same as taking the reciprocal of the quantity with the positive exponent. Thus, $a^{-2} = \frac{1}{a^2}$. A fractional exponent, the numerator of the fraction being unity, indicates the operation of taking that root of the base which is indicated by the denominator of the exponent; thus, $a^{\frac{1}{2}}$.

Exponents are usually understood to follow the associative law ($abc^d = a(bc^d)$), and the distributive law ($a^b(c^d)^e = a^{be}c^{de}$). But in quaternions and multiple algebra the latter holds only in a modified form. In Hamilton's notation of quaternions, $(ab)^c = a^c b^c$. Exponents were introduced into the notation of algebra by Descartes.

extension (eks-ten'shon), *n.* [= OF. *extension*, *extension*, F. *extension* = Sp. *extension* = Pg. *extensio* = It. *estensione*, *<* L. *extensio* (*n.*), a stretching out, *extension*, *<* *extendere*, *pp.* *extensus*, *extensus*, stretch out; see *extend*.] 1. The act of extending; a stretching or expanding. Specifically—(a) In *surv.*, the act of pulling the broken part of a limb in a direction toward the trunk, in order to bring the ends of the bone into their natural situation. (b) In *anat.*: (1) The protrusion of a part away from another part; as, *extension* of the tongue. (2) The straightening of a part, as a limb. (3) The action or function of any extensor muscle, whatever its effect. The continued action of a muscle which straightens a limb may carry a part not only to but beyond a right line, or, at the successive points of a part be already straight, may bend the limb. Thus, when the hand is bent back at the wrist, or at the end of the thumb is re-curved, or the whole trunk of the body is thrown back from the hips, the action or movement is literally *extension*; but it results from the action of muscles which in most positions of the parts tend to straighten or extend them, and is termed *extension*. See *abduction*, *adduction*, *flexion*.

2. The state of being extended; enlargement; expansion; extent.

We entered a large and thick wood of palm trees, whose greatest *extension* seemed to be south by east.
Bruce, Source of the Nile, l. 54.

3. In *physics* and *metaph.*, continuous quantity of space; also, that property of a body by which it occupies a portion of space.

By this idea of solidity is the *extension* of body distinguished from the *extension* of space. The *extension* of body being nothing but the cohesion or continuity of solid, separable, moveable parts; and the *extension* of space, the continuity of unsolid, inseparable, and immovable parts. . . . This space, considered barely in length between any two beings, without considering anything else between them, is called distance; it is considered in length, breadth, and thickness, I think it may be called capacity. The term *extension* is usually applied to it in what manner so ever considered. . . . There are some who would persuade us that body and *extension* are the same thing. . . . If therefore they mean by body and *extension* the same that other people do—viz., by body some thing that is solid and extended, whose parts are separable and moveable different ways, and by *extension* only the space that lies between the extremities of those solid coherent parts, and which is possessed by them—they confound very different ideas with one another. . . . If any one ask me what this space I speak of, I will tell him when he tells me what his *extension* is. For to say, as is usually done, that *extension* is to have parts extra partes, is to say only that *extension* is *extension*, for what am I the better informed in the nature of *extension* when I am told that *extension* is to have parts that are extended exterior to parts that are extended? . . . To avoid confusion in discourses concerning this matter, it were possibly to be wished that the name *extension* were applied only to matter or the distance of the extremities of particular bodies.
Locke, Human Understanding, II, iv, xiii.

Doubtless, *Extension* is the fundamental aspect of the objective world as it offers itself to our apprehension. In our everyday view of things, which psychology has to render account of, space has the same appearance of external reality as the body that fills it; and *extension* is the one attribute that is common alike to body and to space.
G. C. Robertson, Mind, xlii, 420.

4. The character of having continuous quantity of any kind, as length of time, weight, etc.

Rate not th' *extension* of the human mind
By the pelagian standard of mankind,
But by the size of those gigantic rews
Whom Greece and Rome still offer to our view.
Longins, Immortal of Soul.

5. In *logic*, the totality of subjects of which a logical term is predicable. Logical extension is generally understood to consist of individual objects, but some logicians make it consist of species. The *extension* is also called the *supposita*, the *subiecta*, *parts*, the *external quantity*, the *scope*, the *denotation*, and the *breadth*. (See *breadth*.) It is contrasted with *comprehension* and *intension*. Many logicians say that the greater the extension of a term, the less its comprehension; that is the more subjects it can be predicated of, the fewer the predicates that can be asserted of it universally. But this statement takes no account of increase of knowledge.

6. A grant of further time in which to do something which has been set down for a particular day. Specifically—(a) In *legal proceedings*, a postponement, by agreement of the parties or act of the court, of the time set for service of papers or for other acts. (b) In *com.*, a written engagement on the part of a creditor, allowing a debtor further time to pay a debt; more especially, an agreement made between an embarrassed debtor and his creditors, by which the latter agree to wait a fixed time after their claims are due before demanding payment, in order to enable the former to meet his obligations. The agreement is often effected by issuing notes that mature at various times.

7. That by which something is extended or enlarged; particularly (in the United States), an addition to a house, usually at the rear, and not so high as the main building; as, a dining-room *extension*. The term applies whether the extension is part of the original building or is a subsequent addition.

Difform extension, the extension of a body to other bodies, such as a pudding stone. *Extension of title*, in *law*, in parts of the United States, a title from Mexico, the certificate of location usually issued by a land commissioner appointed for the purpose, to designate the particular land on which an original grant is to take effect. It is a title of possession, and is necessary to perfect the original grant which does not attach to a specific land. By its issue the grant is said to be extended upon the land designated. *Uniform extension*, the extension of a homogeneous body, such as a piece of gold.

extensional (eks-ten'shon-al), *a.* [*<* *extension* + *-al*.] Pertaining to or having extension or extent; existing in space.

2. The act of making less, or that which makes less, in importance or degree; a diminishing of blame or guilt in fact or in estimation; mitigation; palliation; as, his faults deserve no *extenuation*; a charitable purpose is no *extenuation* of crime.

Yet such *extenuation* let me beg.

exterior (eks-tē'ri-ōr), *a.* and *n.* [Early mod. *E.* also *exterior*; < *OF. *exterior*, later *exterieur*, *F. exterieur* = *Pr. Sp. Pg. exterior* = *It. esteriore*, < *L. exterior*, outward, outer, compar. of *exter* or *exterus*, outward, on the outside, foreign, < *ex*, out, + *-ter*, *-terus*, compar. suffix. Cf. *interior*. The corresponding *L. superl.* is *extremus*: see *extreme*.] *I. a.* 1. Situated or being outside; pertaining to or connected with that which is outside; outward; outlying; external: as, the *exterior* relations or possessions of a country; an *exterior* boundary or line of fortification. In mathematics applied to a position with reference to a surface in space such that from that position it would be possible to proceed by a continuous motion to infinity without crossing the surface. In like manner, on a surface a position is exterior to a contour if from that position it would be possible to move to the limit of the surface, or to infinity, without crossing the contour. Also, if a space, a surface, or a line be divided into three parts in such a manner that from the first it would not be possible to pass to the third without traversing the second, the first and third are said to be exterior to the second. Upon a closed surface, or curve, the term *exterior* can have only a modified meaning; the larger part is generally regarded as the exterior. When two lines are crossed by a third line eight angles are formed, and of these those that are outside of the space between the first two are termed *exterior*, although if another pair of the three lines is considered as the first pair other angles will be exterior.

2. Related to or connected with the outside; acting or originating from without; outwardly manifested or perceived; not intrinsic.

If I affect it more

Than as your honour, and as your renown,

Let me no more from this obedience rise,

Which my most true and inward dutieous spirit

His ignorance and harmless manners too.

3. Consisting of or constituting the outer or visible part; outwardly observable; external; manifest.

-ey. [See the words quoted.] A termination of various origin, a reduced form of different final syllables in Latin, French, Anglo-Saxon, etc. It is not recognized or felt as an English formative. In some words, as *alien*, *money*, etc., it represents an earlier diphthong; in others the *e* is unhistorical, the termination being a mere orthographic variant of *-y* or *-ie*, as in *honey*, *donkey*, *monkey*, *whiskey*, etc., being referred, as a suffix, to the simple *-y* when attached to nouns ending in *y*, as in *cloney*, *shoney*, etc.

The organ of vision; the physiological mechanism of the sense of sight; an anatomical arrangement of parts by which optical images may be formed; in general, any part of an animal body by means of which the faculty of vision is exercised, or the impact of the light-rays is sensed as a visual impression or optical image. In most of the higher animals, as nearly all vertebrates, the eye is developed as a very special sense-organ of great structural complexity and functional delicacy. But from the point of view of comparative anatomy an eye is any part of an animal body which responds more readily than other parts to the special stimulus of light, or whose activity is specially excited by the impact of light-rays. Thus, an extremely rude eye in the form of a mere spot, often a pigment-spot sensitive to light, is common in low animals, as in infusorians, a. may be situated anywhere on the body, and may be indefinitely multiplied in number. These rudiments of eyes are commonly described as *eye-specks*, *eye-points*, or *eye-spots*. (See cut under *Balanoglossus*.) In various celenterates and echinoderms organs apparently responsive to the action of light occur in various parts of the body and in varying numbers. Somewhat higher in the scale of evolution, eyes become unmistakable in structural character, however dim or uncertain their actual visual function may be, as in worms, snails, etc. But in some of the *Mollusca*, as cuttlefishes, eyes are highly specialized as visual organs of conspicuous character, comparable to those of vertebrates, though constructed on a different plan. In the vast assemblage of arthropods, as crustaceans, insects proper, and arachnids, constituting a large majority of the animal kingdom, eyes as a rule are well developed under one or both of two main modifications, namely, the *simple eye* or *ocellus* and the *compound eye* or *oculus*. (See *compound eye*, below, and cut under *Idex*.) Such eyes are usually only two, but may be four, six, or eight in number. These higher numbers of eyes occur chiefly in arachnids, as spiders. Crustaceans have normally a single pair, often mounted on movable eye-stalks or ophthalmidia, which are modified limbs of one of the cephalic segments. (See cut under *Stalk-eyed*.) A few crustaceans have a single median eye. In vertebrates, where the eyes are normally never more nor fewer than one pair, these organs are received in special formations of the skull, the *sockets* or *orbits* of the eyes; and the eyes are usually further defended from accidental injury by various contrivances, as *eyelids*, *eyelashes*, and *eyebrows*. (See these words.) Other appendages of the eye namable among its "defenses" are the lacrymal apparatus, which secretes tears to moisten the eye, and the glandular structures (Meibomian follicles), which serve for its lubrication by secreting a greasy substance. The front of the eye has usually a special mucous membrane, the *conjunctiva*. The most essential or intimate parts of the organ of vision are contained in a globe or disk, the *eyeball* (which see), which is freely movable in its socket in the higher vertebrates, and rolled about by the action of various muscles, as the four recti and two obliqui of man and the ciliary muscle of some mammals. Externally the eyeball consists for the most part of a tough opaque membrane, the *sclerotic*; but in front, of a hard transparent structure, the *cornea*. These together are the outermost of three *tunics* or *coats* of the eye; the second tunic consists of the *choroid coat* and *ciliary processes* and the *iris*, and the third and innermost of the *retina*, the expanded end of the *optic nerve*, which enters the ball from behind and spreads out upon the choroid to a varying extent. The retina receives optical impressions focused upon it by the crystalline lens, which are transmitted by the optic nerve to the brain, where they are sensed as visual images. The hollow eyeball with its sev-

eral tunics forms a kind of camera filled with certain solid and fluid refractive media. Directly in the axis of vision in the interior of the ball is suspended a solid biconvex body, the *crystalline lens*, serving to bring rays of light to a focus on the retina. The lens, inclosed in its capsule, also divides the interior of the eye into two compartments. The larger rear compartment is filled with a glassy fluid, the

vitreous humor, inclosed in a delicate hyaloid membrane, which may also send prolongations through its substance. In front of the lens, between this structure and the cornea, the space is filled with a more watery fluid, the *aqueous humor*. This anterior space is partly divided into an anterior and a posterior chamber by the iris, which hangs in front of the lens like a curtain with a hole in the middle, the *pupil*. Besides the optic nerve, or special nerve of sight, the eye is supplied with other motor, sensory, and sympathetic nerves, and has its appropriate blood-vessels. In man both eyes look directly forward, their axes being parallel, though the orbits in which they are contained present a little outward, or away from each other. The optic nerve follows the axis of the orbit, and consequently pierces the eyeball behind, a little on the inner side; that is, toward the nose. The muscles which move the ball are six, the rectus superior, rectus inferior, rectus externus, rectus internus, obliquus superior, and obliquus inferior. These muscles are innervated by three motor nerves, the oculomotor, trochlear or pathetic (distributed to the obliquus superior), and abducens (distributed to the rectus externus). The ball is embedded in a quantity of adipose tissue forming a soft cushion, but is also somewhat isolated by means of a thin membranous sac called the *ragged tunic* or sheath of the eye. The ball is nearly spherical or globular, but is a little deeper and wider across than from before backward, measuring about an inch in each of the former axes and $\frac{3}{4}$ of an inch in the latter. (For the structure of the several tunics, see *sclerotic*, *cornea*, *choroid*, *ciliary*, *iris*, and *retina*.) The retina is an expansion of the optic nerve into a large, circular, concavo-convex sheet, which rests upon the choroid with its inner surface in contact with the body of vitreous humor in the back of the eye. In the middle of it and in the axis of the eye is a little rounded elevation, the *yellow spot*, or *macula lutea*, with a depression at its summit, the *fovea centralis*. To

the nasal side of the yellow spot is the entrance of the optic nerve and of the central retinal artery; and here the retina lacks the visual function which characterizes all the rest of its surface. The lens is suspended in a transparent capsule in the axis of vision; it is biconvex, and more convex on its posterior than on its anterior surface. It is about $\frac{1}{2}$ of an inch across and $\frac{1}{4}$ of an inch deep, and its structure presents concentric laminations. It tends to flatten with age. (See *crystalline lens*, under *crystalline*.) The vitreous humor fills the hollow of the eyeball behind the lens. It is a glassy or jelly-like substance, consisting chiefly of water, with a little saline and albuminous material, inclosed in a delicate hyaloid membrane continuous in front with the capsule and suspensory ligament of the lens, and behind resting upon the retina. Some prolongations of the hyaloid enter the substance of this humor, and one of these is called the *canal of Stilling*. The quantity of vitreous humor, or bulk of the vitreous body, is about $\frac{2}{3}$ of the entire mass of the eyeball. The aqueous humor is the slightly saline watery fluid which fills the eye in front of the lens, between this and the cornea, on both sides of the iris, consequently occupying the whole of the anterior and posterior chambers of the eye. Its bulk is very small. (See *conjunctiva*, *lacrymal*, *Meibomian*, *nasal*, *ocular*, *ophthalmic*, *optic*, *palpebral*, *superficial*, *tarsal*, etc.) The eye agrees with other sense-organs in development in the embryo, in being partly formed by the invagination or involution of a portion of epiblast from without, and partly by protrusion or evolution from within of a primitive ocular vesicle, the two coming together in the situation where the lens is to be developed. The result is that a portion of epiblast from the back of the embryo, which had been shut into the hollow of the cerebrospinal tube, pushes out from one of the cerebral vesicles to meet another portion of epiblast from the face of the embryo. Thus, the retina and associate parts are an outgrowth from

the undeveloped brain, while the lens and associate epithelial structures are an ingrowth of epidermis. In other mammals with well-formed eyes the structure is substantially the same as in man, though minor and incidental variations are numerous. The eyes of quadrupeds usually present laterally, and not directly forward. They are usually relatively larger and probably much more effective organs of vision than those of man. They frequently develop a special ciliary muscle or tractor of the eyeball. The iris is commonly black, brown, or of some dark tint, seldom bluish or pale. It often contracts in such a way that the pupil is linear, elliptical, or narrowly oval, instead of circular, as in man. This is well seen in the cat. In birds several modifications occur. The eyeball is strengthened and its shape molded by a set of spindly bones or small bony plates disposed in a circle in the

The eyeball is strengthened and its shape molded by a set of spindly bones or small bony plates disposed in a circle in the sclerotic around the cornea. The ball is hemispherical with an anterior projection, somewhat like a short acorn in a large cup, and the cornea is very convex. The pupil is always circular, though the iris may be so motile as to present only a narrowing round the pupil, or to reduce the pupil to a mere point. These changes are well seen in the eyes of owls. There is also in the vitreous humor a peculiar plaiting or folding of the choroid, called the *macula pecten*. The visual range and power of the eye in some birds, if not in all, are much greater than in man. All birds have three eyelids, the third very fully developed and arranged so as to sweep directly across the front of the eye by means of special muscles and tendons upon the back of the eyeball. No birds are eyeless. In reptiles the eyes are structurally more like those of birds than of mammals. Some reptiles are eyeless, or have very rudimentary eyes. Most have eyelids, but these are wanting in ophidians, a transparent cuticle being continued directly over the ball, and shed with the rest of the cuticle. In fishes the eyes are generally symmetrically lateral, but not infrequently dorsal and closely approximated to each other, and rarely anterior; in one type, the heterosomes or flat fishes, they are, however, both on one side, that belonging to the side which rests on the ground being in the very young in the normal position, but soon actually penetrating through the integument, and with the circumocular cranial region twisting to the opposite side and assuming a permanent position above the regular eye of the colored or uppermost side. The accessories of the eyes of mammals are undeveloped in fishes, but the eyes themselves are sometimes covered by a fold of the integument, and sometimes, as in some sharks, by a peculiar transparent membrane. Among the most characteristic features are the flattening of the cornea and the sphericity of the crystalline lens. In one group (*Anableps*) a remarkable deviation from all other forms occurs, in that the cornea is divided by a horizontal band of the conjunctiva into upper and lower halves, and two pupils are developed, the species consequently being known as four-eyed fishes. In the lowest of the vertebrates (*Branchiostoma*) the eye is represented by a very small spot, coated with dark pigment and receiving the end of a short nerve. See *vision*.

In the crustaceans they are two discoidal plates in the middle of the lateral surface of the wall of the anterior dilated portion of the cardiac division of the stomach and weigh about two grains. Chambers of the *eye*. See *chamber*.—**Compound *eyes***, in insects, simple eyes or ocelli set so close together that their several corneas are in contact, and pressed into tetragonal or hexagonal figures with slightly convex surfaces, giving the eye a faceted appearance, whence the name *faceted eyes*. Each cornea then answers to one of the faces of a cut brilliant.

Behind such a cornea, instead of a lens, is placed a transparent pyramid whose base corresponds to the cornea, and whose apex is directed inward to be received into a kind of transparent calyx answering to a vitreous body. This last is surrounded by another calyx formed by the expansion of a nerve-filament arising from a ganglion on the end of the optic nerve, a short distance from the brain. Each lens-like pyramid, with its vitreous body and nerve-filament, is surrounded by a choroid coat, usually of a brown color. The size and shape of compound eyes, and especially the number of their facets, are very variable. Different facets of the same eye also vary in size.—**Crab's *eye***. He mentally divides the space run over in this second into tenths, and by estimating in what part of it the wire lies, he determines the time of the passage to a tenth of a second.

The method of *eye-and-ear observation* . . . is so called from the part which both the eye and the ear play in the appreciation of intervals of time. The ear catches the beat of the clock, the eye fixes the star.

Some animals, as birds, have a third eyelid, the nictitating membrane, a fold of conjunctiva capable of being swept obliquely across the front of the eyeball; some mammals possess it imperfectly de-

2. A court of itinerant justices.—Adjournment in *eyre*. See *adjournment*.—Justices in *eyre*, judges, either members of or delegates from the King's Great Court or Aula Regia, sent periodically from the capital throughout the other counties of the kingdom for the purpose of holding court. The regular establishment of this system dates from 1176 (22 Hen. II.), and it gave place to substantially the present system of assize and nisi prius, under 13 Edw. I., c. 30. It seems that in the earlier periods, when these justices were empowered to levy royal revenues, remonstrances of the people led to a concession that they should make the circuit only once in seven years. Later, when the judicial function became more important, they were directed by Magna Charta to visit every county once a year.

F. The sixth letter and fourth consonant in the English alphabet, as in the Latin and the Phœnician, and also as in the early Greek alphabet, through which the Latin was derived from the Phœnician (see *A*), although it has gone out of use in the alphabet generally known to us as Greek. The Phœnician character had the name *vav* or *vave* (meaning 'peg' or 'hook'), and its value was that of our English *ve*. This same value it had in primitive Greek use, and it is found so used in western inscriptions, although lost too early to appear in eastern inscriptions. The sound, namely *v*, went gradually out of use in Greek, and its sign went with it. Since the latter somewhat resembled in form one gamma (*Γ*) written above another, the Greek grammarians gave it the fanciful name of *di gamma* or *double gamma*, by which therefore we generally call it as a Greek letter. The comparative scheme of forms (compare *A*) is as follows:

In the adaptation of the alphabet to Latin use the sign first received the value we give it, since the *f*-sound occurred in Latin and needed a representative; the *v* sound was provided for by being written with the same character as *u*. (See *U* and *V*.) The sound *f*, as we pronounce it, is a surd (or breathed, or voiceless) labiodental, a fricative sound or spirant; that is to say, it is made by the audible friction or rustling of the unintonated breath, when forced out between the edge of the lower lip and the tips of the upper teeth, these being held in contact with one another. If, everything else remaining the same, the intonated breath be forced out instead, the sound is *v* (as in *valve*, *virid*); hence, *f* and *v* are corresponding surd and sonant. An *f*, nearly identical with ours in audible character, may also be made between the edges of the two lips alone, without any help from the teeth; and such a purely labial *f* is heard in many languages, and is with probability to be regarded as more primitive than the labiodental *f*, and as forming the transition to it, in the languages where the latter prevails. The same sound is also widely represented in English by *ph*, but almost only in words coming from the Greek; it also exists in some words written with *gh*, as *lawgh*, *cough*, *clough*, *rough*, *tough*, etc., the labial aspirant having taken in such words the place of the palatal, such change being recognized in the spelling in only a few words, as *dwurf*, *draft* (= *draught*), *duff* (= *dough*), as formerly pronounced, etc. Historically, *f* stands in general for a more original *p*, as found in Sanskrit and the classical languages; thus, *father* for *piter*, *parap*, *pater*, etc.

Thus the letter *F* is derived from the Hieroglyphic picture of the cerastes, or horned Egyptian asp.

Isaac Taylor, *The Alphabet*, I. 12.

With the majority of writers, also, a *fact*, or *single fact*, relates only to an individual thing or individual set of things. Thus, that Brutus killed Caesar is said to have been a *fact*; but that all men are mortal is not called a *fact*, but a *collection of facts*. By *fact* is also often meant a true statement, a truth, or truth in general; but this seems to be a mere inexactness of language, and in many passages any attempt to distinguish between the meanings on the supposition that *fact* means a true statement, and on the supposition that it means the real relation signified by a true statement would be empty subtlety. *Fact* is often used as correlative to *theory*, to denote that which is certain or well settled—the phenomena which the theory colligates and harmonizes. *Fact*, as being special, is sometimes opposed to *truth*, as being universal; and in such cases there is an implication that *facts* are minute matters ascertained by research, and often inferior in their importance for the formation of general opinions, or for the general description of phenomena, to other matters which are of familiar experience.

I am wounded

In order to believe that gold is yellow, I must, indeed, have the idea of gold, and the idea of yellow, and something having reference to these ideas must take place in my mind; but my belief has not reference to the ideas, it has reference to the things. What I believe is a *fact* relating to the outward thing, gold, and to the impressions made by that outward thing upon the human organs; not a *fact* relating to my conception of gold, which would be a *fact* in my mental history, not a *fact* of external nature.

3. Thus, whether certain words were spoken is a question of *fact*; whether, if spoken, they constituted a binding promise, is usually a question of *law*.—**Ablative fact**, a fact which according to law takes away a right.—**Collateral facts**. See *collateral*.—**Collative fact**, a fact appointed by law to give commencement to a right.—**Conclusion of fact**. See *conclusion*.—**Divestitive fact**. 3. In *Rom. antiq.*, one of the classes into which the charioteers in the circensian games were divided, one of each contending in a race. A dispute in Constantinople, in 532, between the green and blue factions and their partizans, the emperor Justinian favoring the latter, led to a civil war of five days, which cost 30,000 lives and nearly overthrew the government.

Syn. 2. *Fairy*, *Elf*, *Fing*, *Sylph*, *Gnome*; *Jinn*, *Genie*; *goblin*. *Fairy* is the most general name for a diminutive imaginary being, generally in human form, sometimes very benevolent or inclined to teach moral lessons, as the *fairy* godmother of Underlay; sometimes malevolent in the extreme, as in many fairy stories. Spenser took up the word in Chaucer's spelling, *fayre* or *fayry*, and gave it an extended meaning, which is now commonly confined to that spelling and to his poem; the personages in "The *Fairy Queen*" live in an undated region, essentially like the rest of the world, and are of heroic and occasionally supernatural powers; these personages he sometimes calls *elves* or *chans*. In ordinary use an *elf* differs from a *fairy* only in generally seeming younger, and being more often mischievous. Pope, in "The Rape of the Lock," has given a definite cast to *sylph* and *gnome*; these two words are elsewhere often associated, *gnomes* having always been called as living in underground abodes, and especially as being the guardians of mines and quarries, while *sylphs* are denizens of the air. From this difference of place it has followed that *gnomes* are generally thought of with repugnance or dread, and *sylphs*, although of both sexes in literature, are popularly thought of as young, slender, and graceful females; hence the expression "a *sylph*-like form."
3. Of Oriental imagination is due the *jinn*, *djinn*, or *juinn*; the form *genie* is most vividly associated with the "Arabian Nights"; as, the *genie* of Aladdin's lamp; the *genie* that the fisherman let out of the bottle. A *goblin* is wicked, mischievous, or at least roguish, and frightful or grotesque in appearance. See the definitions of *kobold*, *sprite*, *bravie*, *hulshes*, *sprite*, *plie*, *pixie*, *nymphe*, etc.

Fairy pipes, pipes and pipe-bowls, usually of baked clay and very small, found in the north of England, sometimes with objects of remote antiquity. It is possible that they point to a practice of smoking earlier than the reign of Elizabeth and with other material than tobacco; but it seems probable that they are of the sixteenth century and later. Also called *Celtic pipes* and *clun pipes*.—**Fairy ring** or *circle*, or *dance*, a phenomenon observed in fields, long popularly supposed to be caused by fairies in their dances. It is caused by the growth of certain fungi, especially *Agaricus arvensis*, *A. achilleus*, and one of the *Mycorrhizas*, *Phoscarum circum*. The latter may appear in a single night, forming a circle on the grass as if sprinkled with ashes. The agarics grow outward from a center, spreading further year by year, while the central and inner portions die away. Similar but smaller rings are sometimes formed on old trees and rocks by the growth of a lichen in a corresponding manner.—**Fairy sparks**, the phosphoric light from decaying wood, fish, and other substances, believed at one time to be lights prepared for the fairies at their revels.

A diurnal bird of prey, not a vulture; especially, a hawk used in falconry. The birds used in hawk hunting belong to one of two groups: (a) Falcons proper in an ornithological sense (see def. 2 (c)), belonging to the restricted genus *Falco*, of which the peregrine is the type. These birds rise above the quarry and stoop to it by dashing down from on high; they are most highly esteemed for hawk hunting, and called *birds*. They capture the quarry by direct chase after it, and are called *inables* — a term somewhat loosely extended to other birds of prey which cannot be trained to the chase at all. In heraldry the falcon is generally represented with bells on the legs, but it is necessary to mention in the blazon the bells and their tincture. It is always supposed to be *close* unless the attitude is mentioned in the blazon. Where the falcon is described as *jessed* and *belled*, the jesses are represented as hanging loose.

Families are the unity of which society is composed, as tissue is made of cells, and matter of molecules.

2. Come they of noble *family*!

Why, so didst thou. Shak., Hen. V., ii. 2.

3. In a narrow use, the children of the same parents, considered collectively apart from the parents; as, they (a husband and wife) have a large *family* to care for; a *family* of children. [In all the above uses, frequently used figuratively with regard to animals.]

4. In the most general sense, those who descend from a common progenitor; a tribe or race; kindred; lineage. Thus, the Israelites were a branch of the *family* of Abraham; the whole human race constitutes the human *family*.

Hence—5. Any group or aggregation of things classed together as kindred or related from possessing in common characteristics which distinguish them from other things of the same order. Thus, a body of languages regarded as representatives of a common ancestor, or as having come by gradual processes of alteration and divergence from the same original tongue, is called a family; as, the Indo-European *family*; the South African *family*.

There be two great *families* of things, sulphureous and mercurial. Bacon, Nat. Hist.

The states of Europe were, by the prevailing maxims of its policy, closely united in one *family*. Everett.

Specifically—6. In scientific classifications, a group of individuals more comprehensive than a genus and less so than an order, based on fewer or less definite points of physical resemblance than the former, and on more or more definite ones than the latter. In zoology the name of a family now almost invariably ends in *-idae*, which has the force of a patronymic. The prime divisions of a family are termed *subfamilies*, and end usually in *-inae*. The prime associations of families are in some refinements of classification called *superfamilies*; there is no obvious distinction, however, between these and suborders. The recognition and definition of the family, as of other zoological groups, is entirely a matter of expert opinion, having no natural necessity for being; hence the wide difference among zoologists in their evaluation of the term. A modern family is usually less comprehensive than a genus as used in the last century. The use of the regular termination *-idae* has done much to fix the valuation of the family more stably than that of either the genus or the order. Zoological families are considered as being approximately of the same grade in classification as the groups called orders in botany. Hence the word *family* is generally used by botanists as a synonym of *order*, as *order Ranunculaceae*, the crowfoot *family*. In cryptogamic botany the family is the prime division of the order or suborder, and the prime division of the family is the *subfamily* or tribe, but in some classifications the family is made to rank next to low the tribe. The absolute rank of the family also varies with different authors, the family of one being the order of another, etc. The usual termination is *-ia* (or *-ae*), but *-aceae* (or *-acei*) is used as a family termination in some cases. See *classification*.

7. Course of descent; genealogy.

Go! if your ancestor, but ignoble blood

Noted, Celebrated, Famous, Renowned, Illustrious, Distinguished, Eminent, Notable, Notorious, famed, far-famed, conspicuous, remarkable, signal.* The first nine words express degrees and kinds of the presence or prominence of a person or thing in public knowledge or attention. *Noted, celebrated, famous*, are of an ascending scale of strength, and may be used in a good or a bad sense; as, a *celebrated* thief; a *famous* forger. The use of *celebrated* in a bad sense is rather new and less common. *Noted* is not much used by fastidious writers. *Celebrated, renowned, illustrious*, are also on an ascending scale of strength. *Celebrated* is, by derivation, commemorated in a solemn way, and occasionally shows somewhat of this meaning still. *Renowned* is, literally, named again and again. *Illustrious* suggests luster, splendor, in character or conduct; as, *illustrious* deeds; making one's country *illustrious*. *Distinguished* means marked by something that makes one stand apart from or above others in the public view. *Eminent* means standing high above the crowd. *Notable* is worthy of note, and so memorable, conspicuous, or notorious; as, a *notable* lie. *Notorious* is now used only in a bad sense, having a large and evil name. Specifically—(a) A hand-instrument for cooling the face and person by agitating the air. Fans are made in a variety of forms and of two general kinds, those which can be folded or shut up and those which are permanently expanded or fixed. Fixed fans are made of leathers set side by side, of the leaves of palmate-leaved palm-trees, or of paper or similar thin spread on slender radiating sticks. Folding fans are sometimes made of thin slips of ivory, wood, or papier maché, etc., but more commonly of a continuous surface of paper, silk, or other material, mounted on strips of a rigid material pivoted at one end, and folding together easily in the manner of a plaiting. The most costly and elaborate painted fans were made during the eighteenth century, especially in France, chicken-skin being a favorite material.
